This particular law will, we are confident, contribute little or nothing to the safety of the republic or of its officials, from President down. Even without it, any man, alien or native, who advocated violence to public officer or private citizen was liable to due punishment. Under it, the resident anarchist of the "philosophical" type is still immune. He may entertain the absurdest notions as to the uselessness of governmental machinery, as to the perfectibility of human nature, and as to the reign of universal love when rulers and legal restraints are abolished at a stroke; but so long as he holds these views as mere pious theories, he may go his way untouched. Practically, then, the law operates only in cases of aliens who are professed anarchists.

There's no use crying over spilt milk, but it is always in order to speak one's

mind about the careless or malicious persons who spilled it; and in connection with Gov. Odell's veto of the Law's Delay bill we have just this to say: No one familiar with the whole situation can doubt that politics, and politics of a peculiarly contemptible sort, did this important measure to death. To those who know the inside scheming which brought it about, the talk about Constitutional objections is simply laughable. If there was any real question on that point, why did not the Governor grant a hearing? Is not Judge Dillon's opinion as well worth taking as Mr. Cunneen's? But it is needless to debate about that, since the motive was really unconcealed. What we have seen is politics laying its dirty hand upon judicial reform. If the Republican machine could not have its court spoils, it would deny the prayer of business New York for relief from the scandalous blockade of justice. And as for those judges who were so fearful lest their "discretion" in appointing referees be interfered with, they are doubtless making smiling preparations to go on naming each other's sons and nephews, and other favorites, or creatures of the bosses of either machine, at the cost of litigants.

Particular interest has been felt in the Government crop estimate published last week; first, because of the important relation of the harvests to the country's prosperity, and, second, because of the singular position into which the United States has drifted in the matter of agricultural exports. Prosperity, no doubt, is always influenced by the harvests. This year's special interest in the problem arises from one very interesting fact—that the back-tide of industrial reaction which unquestionably set in last summer in the East, was checked and in large measure overcome by the flood of real prosperity in the farming West and South. There is no question that the highly profitable grain and cotton harvests of 1903 added such genuine strength to the resources of the farming community as to enable the country as a whole to resist the demoralizing tendency of the Eastern money-market disturbance. This is why the crops are now studied with unusual concern. The Department's estimate of April, on the condition of winter-sown wheat, was the lowest in more than twenty years; this was a natural consequence of the trying winter. The new May estimate gives the same figures of condition as in April, and adds that the destruction by last winter's storms reduced the growing area by some 10,000,000 acres as compared with the estimate of December.

This sounds unfavorable; but it must be remembered that the farmer who sows his "winter wheat" in the late autumn always reckons on such vicissitudes. If his early wheat comes up well in the spring, he has so much assured; if it is spoiled by an unfavorable winter, he can plough up his land and replant. There have been, moreover, many years like 1895, when a partial failure of the early wheat was followed by so abundant a later yield that the total crop was one of the largest ever harvested. The situation undoubtedly gains interest from the curious movement of our exports. The latest statistics of the season's shipment of wheat from the United States show the smallest monthly movement reported in this season since the great expansion of our grain production began in 1878, and there can be no doubt that our position in international exchange has been affected by the decrease. But critics are not agreed as to the reason. By many, it is held that the unusually high price fixed for wheat in the Chicago market—the highest since the "European famine" of 1897 and 1898—has cut off our export market; a result not impossible, since Europe itself produced last year 400,000,000 bushels more of wheat than in 1897, and 93,000,000 more than in 1902. Another interesting theory, propounded chiefly by the English grain experts, is that the consuming power of our own population has of late been increasing more rapidly than our grain production; the inference being that the United States, even with a good-sized crop, can spare less wheat than formerly for the outside world. But this is a theory to be approached with much caution.

It is believed by the *Wool and Cotton Reporter* that in some cases it will require years of continuous operation for the cotton mills of this country to make good their losses of the past seven or eight months. That the situation is bad, every one will admit; but it is easy to allow one's self to become too pessimistic. Predictions are always hazardous in the cotton industry. In the early part of 1898, for instance, Mr. T. Jefferson Coolidge and other prominent New England mill owners asked the Massachusetts Legislature to come to the relief of the Northern mills. Their plea was that, unless they were granted longer hours of labor than the law allowed and some rebate of taxation, their business would be driven South. Almost immediately, however, the New England mills entered upon a period of unusual prosperity, which continued up to a comparatively recent date. At the moment the Southern mills are getting a somewhat larger share of the business offering, as the demand has recently been running stronger to coarse goods. Unquestionably, the increase in new cotton mills has been too rapid of late. The number was not excessive for good years, but good years have, of course, to be averaged with poor years. But, year in and out, this country is consuming more and more cotton goods, and foreign markets are being opened up. Just at present our best customers are feeling poor, but the conditions may change at any moment.

Naturally, the chief topic of discussion last week at the annual meeting of the American Cotton Manufacturers' Association was the speculative advance in the staple. President Heath's notion on this subject is rather peculiar. He sees the high price of the raw material on the one hand and the stagnation of goods on the other. This is a bad fix for the manufacturers, but they are largely to blame for it. Everybody could see last fall that there would be a very short supply of cotton, but, instead of accepting this fact and talking with a big voice to make the public pay a correspondingly high price for goods, they became bears on the raw material. But the bulls were too much for them, and quotations went to "dizzy" figures. If the mill owners had not made all this fuss about "speculative manipulation," the public would not have got the idea that goods were artificially high. As it was, consumers held off from buying until prices should fall. All this may be true, but would not things be as bad, if not worse, if the opposite course had been pursued? If there had been fewer bears on cotton the staple might have gone to a much higher level. Is it true that goods have failed to advance as much as the raw material mainly because consumers would not pay more? It has not been a question of would not, but of could not. President Heath may be sure that the manufacturers made no mistake in trying to keep the price of cotton down. If they had acted differently, they might to-day have much larger stocks of unsold goods than is actually the case.

Minister Barrett's figures regarding the foreign trade of Argentina for 1903 should have a good deal of interest for Americans. The total trade was 23 per cent. larger than during 1902, and in the last decade there has been an increase of nearly 90 per cent. This is astonishing progress, as in the last ten years the total foreign trade of the United States has shown a gain of only 43 per cent. In the matter of exports to Argentina, our own country ranked next to Great Britain and Germany. But as regards imports from there, it was behind Great Britain, France, Germany, Belgium, Africa, and Brazil. This leads our Minister to call for a reciprocity treaty. Mr. Barrett is so many thousand miles away that he has not heard of the new official definition of this term—namely, an exchange of non-competing articles. That rules out Argentina, with her wool and

hides. Mr. Barrett tells us that Argentine trade is going to be better in 1904. But of greatest interest is his statement that the country contains 245,000,000 acres of fine arable land, not a tenth of which is yet under cultivation. This brings to mind the statement of Broomhall, the Liverpool grain expert, that the position of the United States is now threatened by Russia and Argentina. A decade ago a great deal was heard about the impending ruin of the American farmer from Argentine competition, but never has he been more prosperous than since then. He can be pretty sure, however, that if he clings to the notion of dollar wheat, he will simply be "holding the umbrella" over South America.

That the Bible is in need of defence from such defenders as the American Bible League, is forcibly argued by the *Independent*. But it goes on bluntly to intimate that there is a "big publishing and financial scheme behind this League." The propaganda against the higher critics, who are said to have "subsidized" the publishers, is to be carried on by means of "branches for Bible defence" all over the country. These are to establish relations with the Sunday schools, and are to furnish by the million "Bible Primers" and tracts, and one knows not what other works up to a Bible dictionary, out of which every taint of modern scholarship shall be rigorously excluded. As the *Independent* puts it: "These men are going at it in the right way for profit for the managers, but not in the right way for the search for truth." We do not believe, of course, that the excellent gentlemen who came forward to save the Bible by denouncing its students, had any ulterior and pecuniary aims; but they must see, now that it is pointed out to them, the peril of turning their League into a money-making concern. Some Simon Magus might be found among publishers, willing to be more orthodox than the Pope, if well paid for it.

Japan is said to feel very keenly the hard terms on which her new foreign loan has been floated. Japanese newspapers are drawing unflattering contrasts between the rate Japan is made to pay and that paid by Turkey and South American countries. But the hardest thing to bear is the lien on the customs revenue, which is regarded as a blow at the national honor, and as placing Japan on the footing of an uncivilized nation. This is stretching the case somewhat; for though we find Turkey and China in the same situation as Japan, we find Greece, and, in a modified form, Portugal, also there. Still, there is no denying the fact that Japan has a right to feel that her self-respect has been impaired. The nation had to have the money and could not get it on better terms. The Government is trying to weaken the effect of the customs pledge as much as possible by claiming that it is "merely nominal, and is based on improbable contingencies." But there's the rub. "Contingencies" are a black beast to investors. One question of great interest regarding the present loan remains unanswered: Has any provision conditionally been made for a foreign administrator of the customs? If so, the situation is indeed mortifying.

The Japanese Government is circulating pamphlets in this country regarding its trade and finances. The figures on the growth of the foreign commerce are amazing. In 1871 the total external trade amounted to less than $20,000,000; in 1901 it was $254,000,000. The increase per decade in population has, however, been only a little more than 10 per cent. But we regret to notice that Japan has started on her new career with an entirely false notion of what constitutes successful trade. In 1901 her exports and imports practically balanced each other, imports being nominally the larger. We are accustomed to think of ourselves as a highly successful nation, but if we saw our imports equalling our exports we should certainly believe we were on the road to ruin. No wonder Japan finds it hard to borrow money on such a showing as this. Still, it seems strange that the nation should be able to keep up this marvellous development of its resources for thirty years on a false basis without coming to grief. Will not our friends of protection unravel this mystery?

A rumor from Berlin has it that the war party in Russia is for making peace on the basis of a Japanese protectorate over Korea and the restoration of Mantchuria to China. Nothing could be more unlikely at this stage of the war. That the Russians have practically given up southern Mantchuria is shown in the abandonment of Niu-Chwang and the destruction of the expensive works at Dalny, but meanwhile Kuropatkin's concentration is progressing, and the probability is that he will try conclusions with Kuroki on the road to Mukden. That battle should determine the course of the campaign for many months. If the Russians should be driven out of the sacred city of Mukden, their prestige in Mantchuria would be shattered, while the Japanese would probably be able to recruit native forces on the spot. So the Russians must fight for Mukden at whatever risk. As for the basis of peace suggested at Berlin, it need only be said that Russia would hardly come off worse than that in case of utter defeat. At this point she will hardly accept the status prior to 1897 for herself, while admitting Japanese preponderancy in Korea. But indeed all peace rumors are silly while Russia retains a foot of Mantchurian territory. What we are at present witnessing is a gigantic scheme of manœuvring the Russians out of the province, and bloodshed has hardly begun.

Well may the Austro-Hungary military demands have caused the "utmost bewilderment among all parties." The Government asks the largest sum ever contained in a budget of the Dual Monarchy. The Austro-Hungary revenues have been running about even with the national disbursements, and the new budget, if voted, means additional taxation, of course. The story in this case is the same as in our own. The money is needed for the army and navy. The former demands 353,000,000 crowns for the coming year, against 324,443,065 crowns last year. The worst showing is in connection with the navy. For 1904 the estimates amounted to 50,026,410 crowns, but for 1905 the demand is for 121,000,000 crowns, an increase of 142 per cent. Forty-eight million crowns are wanted for shops, 34,000,000 for torpedo boats, and 10,000,000 for submarine boats—in all 92,000,000 crowns, or about $18,500,000. The reasons for the present heavy demands are not wholly apparent, but it is strongly implied that the Government has had its eyes opened by Russia's unreadiness for war. In some circles the extraordinary budget is attributed to the additional burden imposed on Austria by the Eastern war in preserving peace in the Balkans.

Almost a year after his epoch-making Birmingham speech, Mr. Chamberlain reports progress to the same audience. He declares that Mr. Balfour is on the way to the true preferential doctrine. He believes that the people are already converted, for he regrets that a referendum is impossible. As to that, dissolution to-day would speedily bring about this desired referendum. But Mr. Chamberlain was cautious enough to hint that the Education bill, the Licensing bill, and other parochial measures had made the Government so unpopular that the result of a general election would be doubtful. But, he continued, there would be no harm in a Liberal interregnum, provided it were short and the fiscal reforms were resumed after its fall. From inadequate dispatches it would be unsafe to infer the temper of Mr. Chamberlain's address; but it is at least evident that he impliedly condemned those acts of his Ministerial associates in which he himself had not been interested, and that he claimed for his personal policy the merit of alone being important and popular. Such a statement leaves Mr. Balfour in the position of a blunderer and man of half measures, who is ruling only till the master spirit sees fit to take hold. That is evidently Mr. Chamberlain's view, and it is not very far from the fact.

THE PARKER CANDIDACY.

Whether or not the Indiana Convention marked high water for Parker, it was low-water mark for Bryan. He fairly flung himself upon Indiana, confident that his appeals would be heard, and the result was not only his defeat, but his open humiliation. Nor have his attempts to make himself party dictator been at all well received by the Democratic press. Newspapers in the South, for example, which have before had nothing but kind words for Mr. Bryan, now speak with much bitterness of his demand that the party ask his consent before writing its platform or naming its candidate. It is, indeed, Bryan and Hearst who are now the surest promoters of Judge Parker's fortunes. The latter's silence never seems so grateful as when contrasted with Bryan's loquacity. As for Hearst, it is a case with him simply of "money talks"—and smells. But Bryan appears to be completely wearing out the patience of the party. It says of him what the Matabele warrior said to the British officer about the Maxim gun—he did not mind the gun that "spoke" once, or even the one that spoke several times, but for the life of him he could not stand the gun that "kept on talking like an old woman."

The fact of the Indiana convention instructing for Judge Parker may easily prove decisive of his nomination. Now put forward as he is by the strategic States, the others will be more and more disposed to follow after. No Democrat can be elected who cannot carry New York, New Jersey, Connecticut, and Indiana. That is conceded, and three of those debatable and necessary States have instructed for Parker. New Jersey is doubtless ready to support him. This gives him a political prestige and advantage which any other candidate will find it almost impossible to overcome. The demand made of every proposed favorite son or suddenly unblanketed dark horse will be, "Can he carry New York, New Jersey, Connecticut, and Indiana?" But those States have already agreed upon another man.

In actually pledged votes, Judge Parker now has a long lead. Claiming none from New Jersey, 128 delegates to St. Louis are instructed for him. That number will rapidly swell as the Southern conventions come along. Georgia is certain to add her 26 votes to the Parker column. So are Alabama and Texas, with their delegations of 22 and 36, respectively. In fact, so strong is the evidence that Parker is to have the support of the Southern States, that we may safely assign him the delegates from all of the solid South except Maryland. They alone would give him, with the votes he has already in hand, something like 430 on the first ballot. This is saying nothing of delegates which he may pick up in Ohio and Illinois, Michigan and Wisonsin, or of the possibility of the vote of New Jersey and Pennsylvania being for him from the first. But even 430 votes is an impressive array—Mr. Cleveland had but 392 on the first ballot in 1884; and it is natural to expect that the same tendency of other "booms" to break up and go to the leading candidate which resulted in Cleveland's nomination on the second ballot, will fall out to the benefit of Judge Parker at St. Louis.

His candidacy has been in many respects unprecedented in American politics. Personal enthusiasm for him cannot be said to exist and to be carrying everything before it, for he is personally unknown to the rank and file of the Democratic party. His name has been identified with no issue. Out of politics and on the bench for eighteen years, his work is not of a kind to be inscribed on party banners. Yet he has had the good fortune, partly by accident of location, partly through the aid of shrewd political managers, partly on account of the repulsion created in decent Democrats by the unspeakable Hearst, and partly on account of his reputation as an upright judge and a frank, honest, and unassuming man, to unite upon himself the hopes of Democrats who look and long for the restoration of their party to its old sanity and vigor.

Such a candidate cannot but be interesting to all; but it would be foolish to deny that there are many doubts which he will have to resolve before he can commend himself to the people of this country. The Hill incubus he must manage to shake off. Hill is a thoroughly found-out man. Every one knows him for a small-minded, cold-hearted, unscrupulous intriguer. If Judge Parker allows it to be supposed that he is "Dave Hill's man," he will be overwhelmingly defeated, as he will deserve to be. Of course, discrimination is necessary, here as everywhere else. No candidate is bound to refuse a vote offered him because he does not like the voter. There is, indeed, a certain element of comedy in the virtuous alarm over Hillism on the part of friends of Roosevelt who, nevertheless, see without a qualm their candidate catering to Quay and Platt. Even the meanest boss alive is entitled to support whom he will. We have no quarrel with Mr. Roosevelt because he accepts the political aid of Platt and Quay; but we deplore his subserviency to them. In like manner, no one can blame Judge Parker for allowing Hill to support him, provided he makes it clear that he is, through all, his own man, and that this is to be a Parker campaign, not a Hill campaign, and, in case of election, a Parker Administration; not one dominated by Hill. At the same time, no friend of Judge Parker's should refrain from telling the truth. It is that while intelligent Democratic sentiment has nothing but kindness for him, it has nothing but loathing for Hill.

To escape from the suspicion of a Hill taint is the first essential for Judge Parker; and next will come the need of showing the country that he has mature and sound views which he can defend with sound argument, and enforce, if given the opportunity, with firmness. With the advantages, he must also shoulder the disadvantages, of being a practically unknown man. Freed thereby from personal animosities and political antagonisms, he may the easier obtain the nomination, but the wisdom and success of his candidacy must remain problematic until it appears that, known, he has the ability, the character, the convictions which the American people have a right to demand in their Presidents.

QUEST OF THE GOLDEN CHAIRMAN.

Next to the difficulty of pitching upon a suitable running mate, President Roosevelt is finding that of selecting an eligible National Chairman most perplexing. The position has apparently been offered to a portentously long list of gentlemen, who have all with one consent begun to make excuse. This is the more strange since the chairman of the National Committee has been, in either party, an officer who wielded enormous power. Not only in the course of the campaign, but in the between-election years, has he had much to do with shaping party policy and influencing legislation and appointments to office. This has been true even when the chairman's party was defeated; how much more so when successful! Now power of that kind is usually sought, not fled from, by men in public life. It is not strange, then, that people are wondering why so many to whom the President has made approaches are saying, "I pray thee, have me excused."

The reason is probably financial. It is felt that this year it is going to be a hard job to put the Republican Committee in funds. Hence the declination of one of the "mentioned" after another is not unlike that of the Russian general who was asked by the Czar some years ago to accept the portfolio of Minister of Finance. "Sire," was his reply, "in the present state of our finances no one would take that post unless he were either a genius or an idiot. I am neither." Or it may be that some of the gentlemen whom the President has requested to accept the Chairmanship have had a scruple similar to that of a prominent Republican urged by President Harrison to become Chairman in 1892. The reason he gave for refusing was substantially as follows: "The Chairman of the National Committee is obliged in these times to raise a large sum of money. If he succeeds in electing his ticket, he is certain to be called a corruptionist. If he fails, he will be

thought a fool. I do not wish to have the reputation of being either."

Every one knows that the legitimate expenses of a Presidential election are very great. They have grown inordinately with the introduction of lavish methods. No books are kept—at any rate, no accounts are ever published—and exact knowledge of the money raised and spent is necessarily within the reach of but few. We have excellent authority for saying, however, that Mr. Hanna had at his disposal in 1896 no less than $7,000,000. Now, luxury in campaigning grows by what it feeds upon. Heroic and unusual expenditures one year come to be taken as the normal standard of outlay thereafter. It is probably true, therefore, that the party which has had the most money in one campaign is called upon to produce still more in the next. Moreover, it is generally agreed among politicians that Republican campaigning comes higher than Democratic. Somehow, it takes more money to "get out" the Republican vote. Perhaps it is that, under beneficent Republican policies, the members of the party are all so busy getting rich that it requires an extra inducement to prevail upon them to leave their gainful occupations long enough to go to the polls.

Whatever the causes, large subscriptions to the campaign fund have somehow to be obtained; and what any prudent man, meditating the Chairmanship, must see, is that they are going to be uncommonly difficult to secure this year. In the first place, with the disappearance of the threat of Bryanism, many Republican purses which fear had opened in 1896 and 1900, will snap shut. Nothing like fright to produce funds; but the coming campaign now promises to be one in which it will be impossible to terrify people into generous contributions. Then, of course, there is the peculiar difficulty of raising money for President Roosevelt. To replenish his overdrawn Wall Street account, at the same time that his anti-Wall Street attitude is exploited for all it is worth in the West, will be the task, almost impossible of achievement, laid upon a Republican Chairman. Clearly, it would tax the resources of the most agile. He would have to be at once a Trust-buster and a Trust-booster.

It would be well if the embarrassment of the Administration over this aspect of the party finances were to lead to a reform. It is needed in both parties. Both have been too lavish and too unscrupulous in the use of money in politics. Both have allowed their Chairmen a degree of secret and irresponsible power, largely through the disbursement of campaign funds, too great for safety, too well fitted to produce corruption. If, as Goldwin Smith says, our political parties have overlaid the Constitution, committees and chairmen have too often overlaid the parties. The malign influence of Chairman-Senator Gorman, after 1884, and of Chairman-Senator Hanna, after 1896, should be a warning even to stout partisans, to say nothing of good patriots. All this financial aspect of party management should be thrown open to the light. If corporations are to be compelled to publicity of accounts, so should political committees. If the mere pecuniary side of the Chairmanship had not been made so unpleasantly prominent, it is probable that President Roosevelt would not have had to hunt so long for a Chairman. Character and political sagacity would be in more demand than the ability to raise secretly and to spend corruptly millions of dollars.

"UTTER DISREGARD FOR POLITICAL INFLUENCE."

With fine irony the Washington correspondent of the *Tribune* begins his dispatch of Friday in this strain: "President Roosevelt has once more demonstrated his utter disregard for political influence in any matter involving right and wrong, by summarily dismissing from the postal service Richard Van Cott, son of the Postmaster of New York." The irony is evident, for the facts presented in the rest of the dispatch show that in his treatment of Cornelius Van Cott the President's surrender to the spoilsmen and politicians may fitly be characterized as contemptible.

It is not necessary to go far into the history of the case. Mr. Van Cott has for years been a machine Republican and spoilsman of the ordinary robust type. He has never scrupled to lay the patronage of the various offices he has held at the feet of Platt or any other boss who chanced to be ascendant. He should never have been appointed to such an important position as postmaster of New York. Having been appointed, he should never have been allowed to demoralize the service by making it the football of politics. No one was surprised when Messrs. Conrad and Bonaparte reported last December—almost five months ago—that Postmaster Van Cott had been operating with Heath and Beavers in illegal salary allowances. Van Cott paid Beavers $4 a day, charged against New York "expenses"; and the Conrad and Bonaparte report not only describes this transaction as "fraudulent," but adds, "We find it impossible to doubt that Mr. Heath, Mr. Van Cott, and Mr. Beavers himself all knew the payment of this additional compensation was expressly forbidden by law, and that it was called 'expenses' to evade this prohibition."

Here was ample warrant for the summary removal of Van Cott, had the President really desired to place purity and efficiency above politics and to redeem his promise of "the immediate reformation of the service by the turning out of the offenders." But, unfortunately for the service, Van Cott had powerful friends in a doubtful State, and the President was willing to suspend action of the "utmost vigor" till there had been further investigation. From time to time there have been rumors from Washington that Van Cott must go, but a day or two later we have always been informed that the investigations were not yet complete. Apparently the "hound's tooth" which President Roosevelt once had in mind as a model of cleanness was both dirty and decayed.

We now learn that one set of inspectors recommended the removal of Postmaster Van Cott, his son, and twelve subordinates. But Senator Platt stood by his protégé, and the President turned Assistant Attorney-General Robb loose on the case, with the evident hope of finding the charges against Van Cott less damning. Mr. Robb has been diligent, and has succeeded. He censures Van Cott for slackness in several directions, but sees nothing in his conduct that has been actually criminal. His prime error has been to allow his son too much authority. This son has indulged in so many and such various irregularities that he must go, but the man who is really responsible for all the crookedness can stay his term out. Mr. Van Cott must, however, refund to the Government some $2,100 of which it has been defrauded. His brother, Whitfield Van Cott, drew $1,800 as inspector of mail boxes, but performed no services whatever. Of course, Cornelius Van Cott dwelt in blissful ignorance of this diversion of $1,800. Young Richard Van Cott drew $300 while in Europe for seven weeks, when the law allowed him only fifteen days' vacation. Here also the elder Van Cott must have been imposed on by a wayward son. The guileless old gentleman was also conveniently blind when the hopeful Richard rewarded his heelers with appointments and promotions, wrote to Beavers that he had promised certain positions in return for ward work, and "usurped the functions of the superintendent of delivery, to the detriment of the service." In short—to put the best face on the matter for Mr. Van Cott—he turned his back while his brother and son pocketed Government money and debauched the public service.

Nevertheless, he is strongly backed by Senator Platt; and accordingly President Roosevelt has once more demonstrated his utter disregard for political influence by making the son the scapegoat. Doubtless the President was guided by those precious sentences in 'The Strenuous Life,' by Theodore Roosevelt:

> "No man who condones corruption in others can possibly do his duty by the community."
>
> "There must be no compromise under any circumstances with official corruption, and, of course, no man should hesitate to say as much."

The incident throws an instructive light on investigations "in our own time and our own way." The Democrats will find it easy to persuade wavering voters that corruption quite as flagrant as that under Postmaster Van Cott will be passed over pretty lightly, especially if the offenders have influential friends. Those quiet little heart-to-heart talks to which the President proposes that Mr. Robb shall devote his summer will—if the outcome be anything like that in New York—excite, not admiration for a strenuous and reforming President, but inextinguishable and derisive laughter.

THE WAR AND PANSLAVISM.

The Macedonian question is settled—so most of the European Powers profess to believe. Turkey solemnly pledges herself to Bulgaria to carry out the measures of reform she promised at Mürzsteg to Austria-Hungary and Russia, while Bulgaria stands charged with the task of suppressing revolutionary committees and conspiracies against the Turkish Empire. For the present, Turkey enjoys serenely the most recent of her diplomatic triumphs; Bulgarian politicians and merchants breathe freely, as the danger of war with Turkey is eliminated; the Austrian press is jubilant; and the various nations represented in the reorganization of the Macedonian *gendarmerie* appear pleased with the respective "spheres" allotted to them. Only from London ominous mutterings are heard. Lord Lansdowne thinks that there is "only too much reason to be disappointed over the progress achieved," and fears that if its rate be not accelerated the Powers "may be confronted by a situation which would cause grave anxiety." Evidently, British distrust of Russia has not been converted into full faith in Turkey.

And Russia herself, so long, in the language of Hammer-Purgstall, "the oracle of Turkish diplomacy, the arbiter of peace or war" in everything concerning the Balkans—Russia, who since the death of Stambuloff has had Ferdinand of Bulgaria in the hollow of her hand, who has dominated Montenegro, carried on a successful propaganda in Crete, shaped the destinies of Servia, and even cast longing eyes in the direction of Rumania—why is official Russia silent in regard to the most recent phase of the Eastern question? The answer must be sought, of course, in the Far East. Whatever the outcome of the war, there can be no doubt that its mere outbreak was a bitter disappointment to the party in Russia which stands for Panslavism—the union of all Slavic races under Russian hegemony, if not under the Russian sceptre. The Macedonian insurrection was one of the most convenient pretexts for the agitators of Moscow and St. Petersburg, and the press of both cities, no less than the leaders of "society," frowned upon a war which threatened to divert attention from Panslavist achievements in the Balkan States.

It was evident that a war in the Far East meant a strengthening of Austro-Hungarian influence in the Near East, and all the effusive sympathy of Czechs and South Slavs, as expressed in telegrams to Russian papers at the outbreak of hostilities, could not disguise the plain fact that, for the time being, Panslavist agitation in Macedonia and elsewhere in the Balkan peninsula had received a check. The change of front on the part of the press, in obedience to authoritative hints, was unmistakable. Both the *Viedomosti* and the *Russ*, which had hitherto been most emphatic in asserting the claims of the South Slavs as against "German aggression," suddenly held the Macedonian question to be of minor importance, and admitted that the fate of the Panslavist agitation depended largely upon the issue of the war with Japan. Most significant was the declaration of Mr. Tcherep-Spiridovitch, the president of the Slavic Charity Union, in an address delivered at Moscow:

> "Slavdom is now passing through a momentous crisis in its history. . . . The hostile sentiment toward us in England, America, Italy, and even in certain circles of France; the endeavors of the Vienna press to stir up public feeling against us, and to create complications in the Balkan peninsula, in order to incite Turkey, Rumania, and Greece against us, and to bring about the annexation of Macedonia and Old Servia by Austria; the incessant hostile agitation carried on within Russia herself, and the encouragement of separatist and revolutionary tendencies in Finland, Armenia, Poland, Little Russia, and among the Mohammedans; the mission to Sweden of the Japanese ambassador at St. Petersburg, for the purpose of fomenting the anti-Russian agitation; and, finally, the possibility of a hostile rising in China—all this imposes upon us the necessity of preventing, by every means in our power, the formation of a coalition which would be far more dangerous than that of the year 1855."

It is clear that the Russian defeats have for the time being put a stop to the more or less open Panslavist propaganda in the Balkan peninsula. Panslavic glory, seventy years ago, lay in purely literary and linguistic union, in which Russia was only one of the elements, together with Poles, Czechs, and the Slavs on the Save and the lower Danube, and on both sides of the western Carpathians. After 1830 even the Poles could for a short time forget the wrong suffered at the hands of Russia, and, under the leadership of their great poet Mickiewicz, swell the Panslavist chorus. To-day, Panslavism is chiefly a political issue, but it may be doubted whether the rallying cry of Russia will ever be as potent as it once was. Possibly we may hear from some centre of South Slavic activity such a protest against Russian pretensions as came a few weeks ago from Cracow, in Galicia, through the Pan-Polish organ of the National League. This league is a secret patriotic organization, whose activity extends over all the three parts of the former Kingdom of Poland, with headquarters in Warsaw; and its address, while undisguised in its rejoicing over Russian defeat, counsels worldly wisdom, and faith in the breakdown of the pernicious government of that blind bureaucracy which has been the bane of Russia and is primarily responsible for her present disasters.

And Russian Panslavists appear equally blind to the effect which the fortunes of the war in the East are bound to have upon the impressionable imagination of the peoples of the Balkan States—for the aspirations of Serbs, Bulgarians, Bosniaks, Montenegrins, Rumanians, Greeks, and Albanians are primarily national, and are becoming increasingly so. Racial consanguinity, literary affiliations, even religious ties, are giving way to considerations of trade and material success. Nicholas of Montenegro, the ablest of Balkan rulers and poet though he be, while as tenacious as ever of his dream of a restored Old Servian Empire, has, through the marriage of his daughter to the King of Italy, entered Old World politics. Servia cherishes the memory of the great days of the fourteenth century, as Bulgaria does those of the old Bulgarian Czars. Albanians—Christian and Moslem alike—are turning toward Italy or Austria for material advantages. In fact, the wonderful success of the Hapsburg monarchy in dealing with Bosnia and Herzegovina has introduced an element into the Balkan problem which every one of the countries in the peninsula will have to reckon with, and which is bound to disturb the dreams of Russia.

THE SOCIAL NOVEL.

Some three years ago the Paris correspondent of the *Evening Post* wrote enthusiastically of an Alsatian novel called 'Les Oberlé.' It seemed to mark the emergence of a young writer, René Bazin, who had devoted an exquisite, if apparently slight, talent to the description of country life in France. Within three years of the appearance of that notable book, M. Bazin has been chosen to fill the chair in the Academy left vacant by the aged Legouvé. The formal reception of M. Bazin gave M. Brunetière an amirable opportunity to comment upon the novel in general, and upon this new novelist in particular, as a representative of the social tendency in fiction. Indeed, these academic orations, however perfunctory at times, have at least the use of supplying an organ of expression for cultured Paris. Under the dome of the Institute are said things—wise and true things sometimes—which in Anglo-Saxon countries re-

main unformulated and only vaguely understood.

At first sight it was incongruous that M. Bazin, a conscious and almost a painful artist of the phrase, should have been selected to make the eulogy of the centenarian Legouvé. For has not Legouvé said of himself somewhere: "I would have been a great soul, and I have been only a good fellow"? Indeed, the contrast is somewhat striking between Legouvé, the delightful *bourgeois* lecturer, faddist, and playwright at large, and Bazin, the self-contained artist of the perishing land ('La Terre qui Meurt'). But the apparent antithesis was not too wide for M. Brunetière's dialectic. He found that M. Bazin's novels, particularly 'Les Oberlé' and 'Donatienne,' were infused with the simple humanitarian spirit so strong in Ernest Legouvé; that Bazin had compassionated the toilers of the farms much as Legouvé had succored the wounded of the siege of Paris. And, naturally, the consideration of social tendency in M. Bazin's fiction gave M. Brunetière a new opportunity to frame in new words his indictment of the old naturalists and realists, and to preach once more his favorite doctrine that literature must be judged according to its social implications.

On this theme he spoke with more than usual eloquence. Recalling that M. Bazin's beginnings fell at the time when the battle of the naturalists was at its height, M. Brunetière struck straight at the great Flaubert:

> "To speak only of the chief, master, and guide, don't you think it would be one of the most painful things in the world to be one of Flaubert's characters? . . . They surely are not the spoiled children of his fancy. . . . How he sets his *bourgeois* up before you and makes them atone for the crime of not being artists! And, without dreaming that he himself perhaps is a little to blame, how he scorns them for having come into the world! Was not that the great error of our naturalistic school? It did not love the creatures its talent had made. . . . Painters, novelists, dramatists, poets even, all, or nearly all, were pitiless towards the lowly world which they represented to us. They studied it, one would say, only to ridicule or insult it. Their doctrine of art was only the expression of their pride as a literary aristocracy. And what was the result? Simply that they have generally expressed and represented only appearances. Truth, which in order to be found needs not so much to be striven for as to be loved, withheld herself from them."

Probably M. Bazin blenched at the insinuation that his art, simply because more pitiful, was greater than that of Flaubert, and the compliment, for M. Brunetière, was heavy-handed; but the novelist of the social disorder throughout rural France undoubtedly agreed with the critic when M. Brunetière said: "Literature is not a diversion of mandarins. . . . Such as we are, we write neither to kill time, nor in the absence of more serious occupation, nor to express our personality (concerning which our fellow-men are much less curious than we suppose), nor to display our virtuosity. . . . The nineteenth century ended by understanding this, and it was all up with the doctrine of art for art." Recalling Alexandre Dumas's taunt that the phrase consisted of three meaningless words, M. Brunetière protested, "No, not meaningless; full of meaning, on the contrary; but of bad meaning, of doubtful and dangerous meaning."

> "One may make Science its own be-all and end-all, because, . . . though we did not exist, the world of science would be about what it is. We may suppose so at least. We may believe, with likelihood, that, though we were not, the planets would none the less swing their orbits across infinite space; and it does not seem probable that if we, some day, should disappear from the surface of the earth, nature and life would be annihilated and disappear with us."

"But art," continued M. Brunetière—"what is art without man? To what would it appeal? What would its subjects be? Art has properly no existence and reality except for man and by man—in humanity, for the senses it delights, for the hearts which it consoles, exalts, or fortifies. That is why the first condition of art is to be human, even before it is art."

No one will imagine that this view is novel. It was formulated in Greece long before Matthew Arnold had said that poetry was "criticism of life," or Tolstoy had more sweepingly insisted that art was the communication of emotion; but it is a doctrine which M. Brunetière has made his own, and a salutary one, to preach to artists. It should not be forgotten, however, that in M. Brunetière's fervor there is a dogmatism quite as marked as ever there was in the art-for-art people. Your scornful geniuses, your Flauberts and Maupassants, cannot so easily be wiped off the slate as abnormal or anti-social. They, too, are a variety of human kind. In fact, M. Brunetière has himself failed in compassion in failing to perceive that the inevitable conflict between the individual and society is far more tragic in the case of the artist than it is in the case of the average man. And he did not admit that, while the world might be the better if artists had generally borne the social yoke meekly, it certainly would be the poorer in works of art. But in general M. Brunetière's homily was wholesome, and M. Bazin is surely incapable of flattering himself that Flaubert is finally dethroned because pity married to literature has produced social novels as good as 'Les Oberlé.'

THE ROYAL ACADEMY.

LONDON, April 30, 1904.

As you enter the courtyard of Burlington House just now, you see, rising in the centre, a large equestrian statue, the first exhibit you come to in this year's Academy, though the last numbered in the catalogue. The figure of a man, nude, muscular, vigor in every limb, sits astride a large horse with the same suggestion of force in its equally well-developed muscles, in its pose and action. In both, there is something heroic, something, you feel before even opening your catalogue, of allegory. And you are right. For, when you do consult the catalogue, you find that the group is the work of Mr. Watts, and that it is called "Physical Energy." That it is noble and impressive purely as sculpture, there can be no question. But you cannot help wondering whether Mr. Watts, with his tendency to preach a sermon in everything he does, did not place it in its present position as a sort of solemn warning or in grim satire. If you could suspect Mr. Watts of a sense of humor, you would think, indeed, that he meant it as a titanic jest, for a less appropriate symbol could not be set up at the threshold of the Academy. If there is one thing more than another one looks for in vain on Academic walls, it is surely "physical energy"—or energy of any kind. It would seem as if the men and women who painted all the anæmic canvases that fill gallery after gallery, had not the strength to use their eyes, as if it were all they could do to hold a brush in their indifferent fingers. It is this general effect of weakness and debility and utter futility that strikes one more and more at the Academy as the years go on, and as the artists of the slightest individuality and accomplishment become more and more disinclined to contribute to it. But, for this very reason, any work that reveals the least strength, the least "go," the least indication of personality, appears at the Academy the more remarkable. And so I am brought round again to Mr. Sargent.

It has been the same now for some time past. Mr. Sargent triumphs by sheer "physical energy." His canvases, full of life and vigor and vivacity, make him tower a giant among the anæmic pygmies, however he might stand worthier competition. And at the present moment he is showing not only at the Academy, but in three other of the principal London exhibitions. At the New English Art Club, whose members have at least enough energy to want to see and express things in the right way, even if they do not always succeed in doing so, Mr. Sargent has a small study in water-color of a couple of Spanish soldiers lounging in their barracks that makes everything round it fade into insignificance, so surely and swiftly does he, with simple washes and a few touches of pure color, get what the other exhibitors, using the same medium, miss altogether, despite—or because of—their imperfectly concealed striving. That several studies—again of Spanish soldiers, of a vase in a garden, of the Salute in Venice—should produce the same impression at the Old Water Color Society is less surprising, for members of that eminently respectable British institution have, ever since William Hunt, looked upon niggling and minute finish as the supreme virtues of the art of water-color. Then, at the New Gallery, Mr. Sargent has two portraits—one of an elderly, gray-haired lady; the other of Mr. Lucy, "Toby, M.P.," whose dulness in *Punch* is such a perplexing contrast to the brilliancy of his reputation. But these two portraits are far from representing Mr. Sargent at his best, and, anywhere else, I fancy they would

not strike one as particularly notable. Nor do I think the six at the Academy—the Academician is now limited to six works—will eventually be counted among his finest, while certainly of these the three most ambitious in size and scheme cannot be considered the most successful. Already, the large full-length of the Duchess of Sutherland is the most talked about of the six, though this is due not to Mr. Sargent's work, but to the social rank and notorious beauty of his sitter. It may seem extraordinary to find fault with Mr. Sargent for over-prettiness, and yet he now comes dangerously near it; beauty apparently bewildering rather than interesting him. Of course, judged by Academical standards—for example by Mr. Dicksee's excursions into millinery, the fault might be thought to lie the other way. It is Mr. Sargent's luck that in London he is always judged by such standards.

The Duchess stands in a shady garden, and against the background of dark green foliage the paler green of her long flowing gown makes a cool, pleasant harmony. Her neck and arms are bare. One hand rests on the rim of the low basin of an unused fountain, the other falls lightly at her side, holding a branch broken from the near thicket. The pose is graceful and charming. But it is not easy to understand why the sunlight that falls here and there on the gown and, beyond, on the marble pedestal and bust under the trees, should have no effect whatever on the flesh of neck and arms. It may be said that the whole arrangement is conventional—the arrangement of the eighteenth-century portrait painter. But why should the play of light on minor details be carefully observed and noted when the most important part of the picture is summarily disposed of according to the laws of an outworn convention?

The large "Countess of Latham" is still more formal in design and treatment. The pose of the seated figure, the flow of the sumptuous velvet draperies, the architectural background with its accompanying curtain, all suggest Lawrence; so much so, that I wonder if the portrait were painted after last winter's exhibition at the Academy when Lawrence was the "Deceased British Master" to receive special prominence. But there is nothing of Lawrence in the head. It suggests no one but Mr. Sargent—and Mr. Sargent when the personality of his sitter has aroused in him not the shadow of interest. I seem to have seen the same head in more than one of his recent portraits.

At the third of his large canvases it is impossible to look with unprejudiced eyes so long as it hangs in the present exhibition. It represents Lord Londonderry in his robes of state, and it so happens that there are two other portraits almost as large, by two other painters, of two other dignitaries in all their official splendor. One is "The Marquess of Linlithgow," by Mr. Robert Brough, who, a few years ago, was thought almost the most promising of the younger men; the other is "The Earl of Shrewsbury and Talbot," by Mr. Herkomer. But in neither has the imagination of the artist carried him beyond the pose, the accessories, the vision of the photographer, and it must be a court tailor's dummy upon whom the robes are hung. But Mr. Sargent has at least risen to a sense of the stateliness these robes demand. He shows Lord Londonderry not only in his official dress, but performing his official functions, as he appeared at the Coronation. Through the dim aisles of the Abbey he advances, bearing aloft the great Sword of State, with a swagger which I hope is not wholly the artist's invention; his gorgeous train and peer's coronet borne by a little page in a costume scarcely less picturesque. But again one asks if the distinction of the portrait is due to the merit of the painter or the feebleness of his rivals. And, really, even at the Academy, the "Lord Londonderry" does not appeal to me as much as the smaller, less gorgeous, less pretentious portrait of Mrs. Wertheimer. Here there is none of the audacity that has made Mr. Sargent's paintings of other members of the family so sensational. It is a fairly quiet study of an elderly woman, of the quality of the warm flesh of a face under a heavy coat of powder, of the different textures of an elaborate black gown, of rich ornament in the various detail; and it is painted with the knowledge which, at the Academy, is a pleasure in itself. What a comfort, how restful, after the Academical bungling and clumsiness, simply to have one's eyes carried so easily down the gilt curves of the chair by the long, sweeping, expressive brush marks! For rendering of character the still more unpretentious study of Gen. Wood, U. S. A., is finer; while if the presentation portrait of "T. L. Devitt, Esq., President of the Shipping Federation," fails to interest one as a portrait, the model of a ship that fills the background is perhaps the best piece of painting in the Academy. But, having said so much, I must add that one begins to feel in Mr. Sargent's portraits something of fatigue, as if he had been "turning them out" too rapidly. Only, even in his fatigue, he is more vigorous than the average exhibitor at the Academy.

You have only to glance at the other portraits to realize how much he gains by the absence of competitors. Mr. J. J. Shannon is unusually uninteresting this year. Signor Mancini's eccentricities of technique are a drawback to qualities otherwise amusing in his work. Mr. Charles Furse, lately elected an Associate, whose principal portrait balances Mr. Sargent's "Duchess of Sutherland" on the walls of the large gallery, comes very near failing altogether from a too obvious determination to be vigorous at any cost. His "Diana of the Uplands" (his title for the portrait) stands holding-in two impatient greyhounds as she struggles against the wind that sweeps across the high moorland. She wears a long white silk cloak and a large-flowered hat, as out of place in her surroundings as the exaggerated movement seems in such a conventionalized landscape. Here you have vigor bought at too dear an artistic price. And there is a similar contradiction in Mr. Furse's portrait of Mr. and Mrs. Oliver fishing in a rocky pool. Everything is as realistically rendered as possible, except just what is most essential—the atmosphere. The two figures, especially that of the man, are as flat as if cut out and stuck on the canvas. Mr. Furse, you would think, had been exhausted by his bid for independence in the composition. I have already heard Mr. Orchardson's portrait of Sir Samuel Montagu much praised. But it would be difficult, surely, for any painter of ability not to realize so pronounced a type, and beyond this realization I see nothing in the portrait, certainly none of Mr. Orchardson's finer qualities. Indeed, this is not a notable year for him. In a portrait of a woman—just the head and shoulders—he has had more of a chance for the exquisite detail he loves in the chiffon of the bodice and the roses stuck in its folds; but the face is curiously empty. As for the other portraits, there is none to which special attention need be called, unless for the distinction or notoriety of the sitter; as, for instance, in the case of Mr. Herkomer's "Mr. Chamberlain," though I do not know whether it was to accentuate those now familiar characteristics, thanks to which the task of the British caricaturist has been made easy for him, that Mr. Herkomer shows himself unexpectedly reserved in the treatment of the room he has given Mr. Chamberlain for background.

There is some little pretence of vigor in a few large allegories that might have strayed from the Salon. At least, the men who painted them had the energy to attack a large stretch of canvas. But this is their only virtue. Nor can more be said for the one or two huge records of public ceremonies; this sort of subject could not be seen, and then rendered, with more crudeness than by the British artist. The only large decoration, done for a definite purpose, that promises to prove effective when in its proper place, is Mr. Brangwyn's "Departure of Lancaster for the East Indies," one of a series of panels for the Skinners' Company. It is badly hung at the Academy, which might seem a matter of course if Mr. Brangwyn were not one of the lately elected Associates; his election and Mr. Furse's being looked upon as the Academy's concession to the recent loud and severe criticism of Academical policy. As far as one can tell, as one studies the panel here, Mr. Brangwyn does not rely solely upon the size of his canvas to give a feeling of bigness and dignity to his design. He knows how to distribute his figures, how to make them tell as spaces of strong, harmonious color. The groups that build up both sides of his composition separate to show, between, the blue water, a ship with sails spread, and, above, a blue, romantic sky. And throughout he observes an intelligent regard for the decorative value of his painting on a flat wall. Sometimes Mr. Brangwyn threatens to fall a victim to his own mannerisms, and admission into the Academy, unfortunately, is not an inducement for an artist to do the best that is in him. But in this panel Mr. Brangwyn has done his best as well as one can see, and there are few things as strong in the exhibition. Another piece of decorative work, smaller in scale and simpler in design, is Mr. Abbey's central panel and the reredos for the Church of the Holy Trinity in Paris. Mr. Abbey has taken the old altarpiece of the Primitives as model. On a background of flat gold the cross rises in very low relief. On it hangs the Christ; on one side St. John holding the chalice, on the other the Blessed Virgin with clasped hands. But if the design of the Primitive is easy to copy, his unconscious, his unintentional naïveté is not. Mr. Abbey's faces are too modern, while, in the endeavor to produce the necessary flatness of effect, the draperies are not

only without modelling, but without the decorative lines and folds the Primitives knew so well how to give them. It seems to me that Mr. Abbey has fallen between two conventions. He has another picture, "A Measure," a large upright. Out of the subject he might have made one of his charming pen-and-ink drawings. In the foreground, a woman, in voluminous white draperies, moves in a melancholy dance; beyond, halfway up a flight of stairs, two musicians, in the costumes Mr. Abbey knows so well, are posed; at the top, a group of people look on; and to their left, through an open loggia, are glimpses of a brilliant blue sky—an arrangement, however, that would tell to better effect on the stage of the old Lyceum, or the new His Majesty's, than on canvas within a frame.

A few landscapes are among the rare pleasures of the exhibition. On press day, a critic whispered in my ear that it is a Clausen year. I cannot quite agree, for I have seen pictures by Mr. Clausen that surpass in poetry of conception and charm of execution the four he is now showing. But Mr. Clausen always has the grace to try and see Nature pictorially and to remember that there are such things as light and atmosphere. After the big Academic arrangements by Mr. Waterlow and Mr. David Murray, after the too evident, artificial attempts by Mr. Alfred East to "arrange" his landscapes on the old picturesque lines, it is a relief to come to Mr. Clausen's quiet, honest study of "Willow Trees" and of the sky at evening, or of his group of "Gleaners" returning from the fields. In the first he shows that he has learned from Barbizon how to lead your eyes into his picture, so that, without being distracted by disturbing detail, you can see the loveliness of the heavens in which the last glory of the sunset lingers, and the strange tone, the mystery, of the willows silhouetted against it. And he seems to have brought his weary "Gleaners," with their ungainly bundles, trudging homeward, to the very front of his picture, so as to make you feel how statuesque the laborer may become in her weariness—how even a shapeless mass may have its pictorial value if only it keep its relative place in the aerial envelope.

I often think that Mr. La Thangue, by emphasizing his own crudeness, helps one at the Academy to appreciate Mr. Clausen's refinement. For Mr. La Thangue, choosing very much the same subjects, refuses to see them pictorially that he may, as he probably believes, see them more realistically. And so his sunlight, whether of the brilliant south or the cold north, hurts with its hard glitter. His figures appear to be made of cast iron, to have been looked at through a camera. M. Thaulow has one of his marvellously true studies of snow and ice in Norway, and another of running water in "The River Dordogne." Mr. Adrian Stokes and Mr. Edward Stott both have characteristic pictures, and other good landscapes might be discovered if it were not, apparently, an article of faith at the Academy that paintings should be hung so as to show to the worst advantage.

The water colors and black and white, as usual, are feeble beyond belief; which is the more unpardonable as only this winter the International Society proved what tremendous interest could be given to a well-selected and well-hung series of drawings and prints. In the Sculpture Gallery, from Mr. Alfred Gilbert one has the same bracing feeling of "physical energy" as from Mr. Sargent among the painters. He shows the head of an old woman in an enormous hood drawn over her cap, and he calls it "The Mother of the 9th Symphony," much to the bewilderment of the critic. But it makes little difference what he calls it, or what it means. I have seldom seen such a wonderful study of an old face, lined and wrinkled, but strong and beautiful with age. The detail of exquisitely suggested lace and a rosary at the throat seems a trifle inappropriate, but Mr. Gilbert cannot suppress his delight in delicate detail — the goldsmith's delight; and, after all, it does not destroy the solemnity of the face. There is also a bronze group of "Angel and Child" for a tomb, by Mr. John H. M. Furse, as beautiful in sentiment as in form and line. Mr. Swan's little statuette "A Mermaid" proves how well he understands the value of silver to the sculptor. But there is little else. And artists and craftsmen will miss the examples of enamel and of the silversmith's work that sometimes have been such a feature in the sculpture section. Mr. Alexander Fisher, Mr. and Mrs. Nelson Dawson, hitherto frequent contributors, now send nothing. N. N.

CORSICA.

CORSICA, April, 1904.

All the islands of the Mediterranean have some features in common—a keen, dry, brilliant air, picturesque shores, a flora of the same general type. But Corsica is unlike all the rest in its greenness, and in respect of its greenness it is the most pleasing to the eye. The interior of Sicily is bare and brown. There is a good deal of Africa about Sardinia and the Balearic Isles; while many of the eastern islands, and especially the "shining Cyclades," are little better than masses of bright white rock set in a blue sea. Corsica, however, has verdure everywhere, not only because her situation gives her a pretty copious rainfall, but because the great height of the central mountains provides stores of snow which feed the streams till far on in the summer. Thus she is in many ways the most striking and romantic of all these Mediterranean isles, with peaks loftier than any in Sicily (except Etna) or in Crete or in Cyprus, and a combination of elements of beauty scarcely to be found elsewhere.

Corsica is full of mountains. A lofty chain traverses it from north to south, sending off so many spurs in all directions that there is, except in one district on the east side of the range, hardly any level ground in the island. A mountainous country is not necessarily a beautiful country; for though it must always have elements of grandeur, it may be grim, hard, forbidding, as are the mountain regions of large parts of Asia and Africa. Forms may be tame, color may be dull or monotonous. But in Corsica, with its abundant streams and its luxuriant vegetation, the mountains secure their full landscape value. They rise within a few miles of the sea to heights often exceeding eight thousand feet, and so make upon the eye a due impression of their magnitude. Their lines are usually bold, and often noble. They are mostly built of granite, gneiss, or porphyry, and so have that solid strength and majesty which specially belongs to the old crystalline rocks. Their crests bristle with spiry pinnacles, their faces show long rows of projecting towers, while beneath there are deep gorges, where a torrent roars through a trackless glen between unscalable precipices. One is reminded sometimes of the high Alps, sometimes of the finest among the cañons of the Rocky Mountains. The snow, moreover, which on the Apennines disappears altogether in the summer, remains in this moister air till July or August upon the loftiest peaks, and gives an indefinable sense of remoteness and purity to the glittering summits.

In another respect Corsica has a great advantage over even the wildest parts of the Apennines. She has retained a great part of her ancient forests. On both sides of the central range, at heights varying from two to five thousand feet, the valleys are filled with dense woods. The lower zone is composed, as in Italy, mostly of chestnuts; the upper zone of beeches. Both are beautiful, in their several ways. The beech has a brighter green, and more frequently reaches a great size. But the chestnut permits a freer growth of grass and of shrubs beneath its shade, and gives sylvan landscapes of incomparable loveliness. Very different and even grander in their effect are the pine forests, of which a good many still remain in the inner valleys, under the shadow of the great peaks. The Corsican pine (*Pinus Laricio*), tall, straight, of a sombre dark green, attains a great age and vast dimensions. Many and many a tree is two or three hundred years old, and far exceeds a hundred feet in height. No forests of evergreens in the Alps or in Germany rival the stately gloom of such Corsican valleys as Bavella, Aïtone, or Valdoniello. This last-named fills a deep circular hollow under the pass of the Col di Vergio. Lofty mountains, snow covered till May or June, raise their stupendous rocky walls above it; green pastures sweep down to it from below the rock walls. It lies beneath, a vast, sombre mass, here and there open where the woodcutters have been at work, and letting the huge, straight bare trunks, crested at the top by a mass of foliage, display their splendid proportions; in other places, so dense as to make a green twilight of darkness and silence. The wind sweeping up the valley sometimes sinks to a moan, sometimes swells to a deep roar, which rises from the hollow and echoes far away among the recesses of the crags.

Not less beautiful than are these inner forests, and far more cheerful, is the vegetation which clothes so profusely the lower hills and descends to the very edge of this sunny Southern sea. Corsica has of all the Mediterranean coasts the greatest abundance of scrub wood and undergrowth. Nothing is so characteristic of its scenery as are the masses of shrubs which form what the people call *macchie* or (in French) *maquis*. This shrub growth consists chiefly of heath, sometimes fifteen or twenty feet high, with a wealth of whitish or purplish flowers, of glossy arbutus, of lentisk with its reddish blossoms, and of two kinds of cistus—one with large blossoms of a brilliant pink, the other with somewhat smaller white flowers, resembling at a little distance the white roses of an English hedgerow. Other plants grow among the *maquis*, especially the aromatic

rosemary with light blue, and the lavender with dark purple, flowers, as well as more than one kind of a broomlike shrub whose yellow blossoms light up the pale heath and the darker green of arbutus and ilex. It is these shrubs that give to Corsica that peculiar scent of which Napoleon used to talk at St. Helena as the feature of his birthland that most recalled it to him, as indeed it most dwells in the memory of those who know the isle, for nothing takes a stronger hold on memory than odors. It is half pungent from the aromatic flowers, half sweet from the honeyed leaves of the cistus and the fainter scent of the heath blossoms. It comes out best under the sun; nor is anything more delicious than the whiffs of fragrance which the cool mountain breeze brings down along these slopes.

One other feature of the vegetation must not be forgotten. The evergreen oak, at times low enough to be a part of the *maquis*, sometimes becomes almost a forest tree, and, with its graceful outline and its dense dark-green glossy foliage, forms here and there thickets of singular beauty. Thus there is hardly a hillside, save the highest pastures and craggy precipices, that has not in Corsica some charm of wood or shrub or flower; the variety as remarkable as the luxuriance.

But Corsica is not only a land of mountains. It is also an island, and the sea penetrates its western and northern coasts in so many deep inlets as to be almost everywhere near, and a constant presence in views from the heights. Beyond the foreground of rocky peaks or gorges, beyond the middle distance of woods or heath-clothed slopes, one has the shining sheet of the Mediterranean—blue if it be near, gray if more remote—stretched out on the horizon of all the wider prospects, adding an amplitude and a mystery to the grandeur of the forms and the richness of the colors. All the western shores are lovely, with their endless succession of bays guarded at each horn by foam-lit promontories, while, far within, the wave ripples more softly on a beach of sand or pebbles. But perhaps the most attractive piece of coast is that which forms the western side of Cap Corse, the long and narrow peninsula that projects thirty miles northward from the main mass of the island. Here mountains rising steeply to three or four thousand feet descend in thickly wooded slopes mostly covered with *maquis*, but sometimes also terraced by the labor of many generations into vineyards and olive yards and citron orchards and tiny fields of corn. The road, mostly keeping several hundred feet above sea level, winds along a shelf cut in the rocks, sometimes climbing a bold promontory, sometimes doubling up one of the deep glens through which cheerful little brooks descend from their fountains high up among the hills. Villages more populous and more prosperous than in almost any other part of Corsica (for the people are here exceptionally industrious) are built irregularly along the slopes that face the western sun, half covered during springtime by the soft white veil of pear and plum and cherry blossom. To the southwest the great snowy line of Monte Cinto and its companions bounds the view, while beyond the blue sea-plain the summits of the Maritime Alps can in clear weather be faintly descried. Of all the beautiful landscapes which the Mediterranean coasts have to show, there is none, not even the northern side of Majorca, more beautiful than this, because none is so rich in its mingling of wild verdure with what Homer calls the rich works of man.

One other piece of scenery deserves to be mentioned, because in it, too, the grandeur of land and sea is brought together. The village of Evisa stands not far from the west coast on a grassy ridge, over which chestnut trees are scattered, some 2,600 feet above the sea. Behind it to the east is the great forest of Aïtone, filling a valley between lofty mountains, the northern range topped by a line of savage granite crags. On the north, just behind the village, this green ridge drops in precipices to a gorge so deep that the eye cannot reach its bottom. Full to the west the gorge, joined from the south by another almost as deep, falls to the sea between tremendous rock towers, square towers of red porphyry, standing out on each side from the main mountain masses, and forming a sort of gigantic portal through which the river descends to the bay of Porto. I saw this portal first at eventide, when heavy mists hung over the tops of the crags, and the setting sun shot from beneath a cloud a ruddy glow over the cliffs, with a faint gleam reflected from the dim gray waters. It looked like the gateway to some unknown world, such a gateway as Dante might have set upon the path that led to the waters of Cocytus. I saw it again in the morning, when the piece of sea framed between the red rock walls shone like a sapphire, and the full light showed pine trees clinging to the face of the precipices, and white lines of waterfalls flashing among the crags. The little sandy bay, guarded by these mighty walls, with a soft murmur descending from the great dark forest behind, seemed such a strand as that on which Ulysses found the Lotus Eaters, happily far removed from the world of toil and care. Nor was this little bay less lovely when, following the track down the gorge, one reached the gentler slopes that surround it. I have never seen a more striking contrast than was here between the inexorable sternness of the mountain lines and the rich, soft profusion of the hanging woods, evergreen oak and sheeny arbutus and fragrant heath, lit up by the pink and white blossoms of the cistus and the yellow masses of broom, mingled with olive and fig tree, while in front there was the serene immensity of the sea, neither stern like the rocks nor genial like the woods, but impassive, changeless, silent, yet voiceful with the ripple of many waves.

Scenery like this, or like the Calanche, to which one comes following the road to the southward round the coast, a succession of deep ravines between precipitous towers of rock falling abruptly to the sea—such a landscape as might be formed by setting the aiguilles that surround the Mer de Glace in a blue sea from which only their upper three thousand feet would stand out—ought to have inspired poets or occupied painters. But Corsica has had no poet and no painter. Nor has this scenery any associations with the life of man in the past. Nothing seems to have ever happened there. One feels in gazing on a Corsican landscape much as one feels in the solitudes of the New World, in the Rocky Mountains, or the Yosemite Valley, or among the forests of eastern Cuba. Nothing seems to have ever happened in Corsica. It is nature and nature only that one has to thank for whatever of beauty there is. The villages are, as a rule, singularly unpicturesque, with their tall, bare, austerely plain houses, standing detached upon the hillside, never a creeper trained upon them or a flowerbed by the door. Scarcely a church seems more than two centuries old; scarcely any has the smallest architectural merit. The only relics of the past are the watch towers, usually round, but sometimes square, that stand at intervals along the coast, most of them built by the Genoese in the days when Barbary pirates hovered round these shores, ready to swoop down upon any defenceless hamlet and carry off the inhabitants into slavery. The people of Corsica seem to have been in past centuries but slightly affected by the general movements of European life, and they have left few memorials of their earlier days. But the people of Corsica are too large a subject to be discussed at the end of a letter. I must reserve for another a few comments upon them.

Correspondence.

THE "TOMB OF IDOMENEUS" AT KNOSSOS.

To the Editor of The Nation:

Sir: Mr. Arthur Evans has not yet closed his this year's campaign at Knossos, and accounts of his fifth year's work upon the site of the Labyrinth are not yet received, beyond the general statement that work there is making good progress. But again there has been a surprise resulting from trials made upon ground adjoining the House of the Double Axe. By the end of April, excavations in a headland north of Knossos which widely commands both land and sea in all directions, and towers above the Labyrinth site, have brought to light a great stone Mausoleum consisting of a square chamber capped by a lofty gable constructed after the fashion of the Cyclopean pointed galleries in the fortress at Tiryns. This chamber is approached by an arched entrance-passage. There seems no doubt that this passage was arched, although its upper courses have been much ruined and the whole of it has been seriously quarried into. This combination of the arch with the "Cyclopean" gable is most unexpected, and somewhat disconcerting, since the gable has hitherto figured as a makeshift for the arch in early buildings of this kind. In other ways, too, the new building is quite unique. Its magnitude may be roughly guessed at from the fact that it has taken sixty men a fortnight to clear the débris. That its general nature is sepulchral may be gathered from the discovery of a cist-grave below the floor in one corner.

Nearly all the metal objects which may confidently be supposed to have been placed wihin the great square sepulchral chamber have disappeared. Doubtless they were removed in ancient times. Nevertheless, scattered relics of the original contents have been found. Interesting among these are clay impressions of the royal signet, familiar already as found in various parts of the Labyrinth. Indeed, not only

originals but evident forgeries of this same signet have come to light there. Another link demonstrating close connection with the Labyrinth was forthcoming in the remains of painted jars of the finer "palace style." This style has received its name from the Knossian palace, where alone examples of it had hitherto been found. Also, a carved stone lamp with a pommel of crystal was unearthed in the sepulchral chamber, and finds its nearest analogue in the stone vases, lamps, and crystal objects already discovered in the palace near by. From the newly discovered Mausoleum also have been taken several objects which must be classed with the examples of early Egyptian art gathered up here and there in the palace. Mr. Evans mentions among the new discoveries of this class an Egyptian basalt bowl, an Egyptian necklace of lapis-lazuli with pendent figures, and many alabastra.

He surmises that the sepulchral monument thus discovered was built for one of the last kings of the House of Minos, inasmuch as only one grave was found in it, although there was room and to spare for others. Accordingly, he hazards the conjecture that this great monument may perhaps in some way represent or stand for the traditional tomb of Idomeneus, mentioned as one of the sights of Knossos by Diodorus (v. 79), who even gives the epitaph that stood upon it. It is needless to say that no such inscription has come to light as that quoted by Diodorus.

LOUIS DYER.

OXFORD, May 4, 1904.

SHAKSPERE'S BOHEMIA.

TO THE EDITOR OF THE NATION:

SIR: It is very strange that the "learned" ever should have puzzled over the seashore of Bohemia in the "Winter's Tale," since the perfect explanation lies wide open, at least as soon as we open Greene's "Pandosto," from which the play is taken and where that shore appears. It would be precisely like wondering "for 300 years" at some large departure from history in "Macbeth," and never observing the same in Holinshed. Some of the historic facts noted—Bohemia having played a far larger rôle in earlier centuries than recently—might account for Greene's conceptions; but those of a sixteenth-century novel are hardly more needful to account for than the like in romances of Arthur or Charlemagne. This Bohemia of course is fairyland, with no more relation to geography than that of city "artists."

Respectfully,

EDWARD FARQUHAR.

WASHINGTON, D. C., May 15, 1904.

Notes.

The French Société des Bibliophiles is preparing a study of the illuminated MSS. of Augustine's 'De Civitate Dei.' They are very desirous to discover the possessor of the MS. of this work which was sold on May 23, 1889, by Messrs. Sotheby at the Hamilton sale. Information should be sent to Comte A. de Laborde, 5 Avenue du Trocadéro, Paris.

Mr. Berenson some months ago called attention in these columns to a project for publishing photographic reproductions of works of art in English private collections and elsewhere. This has now taken shape in The Arundel Club, whose committee is headed by Lord Balcarres, associated with Sir Walter Armstrong, Sir Martin Conway, Sidney Colvin, Lionel Cust, Claude Phillips, John S. Sargent, and other weighty names. The annual subscription is one guinea, and if a start is made with 100 subscribers, probably fifteen photographs will be the return to each member; the number of prints increasing with the support. It is in contemplation to issue a second and even a third series for subscribers willing to pay therefor. But the first series will be tried alone, and will deal wholly with the Old Masters. The honorable secretary to be addressed for enrolment is Robert Ross, Esq., No. 10 Sheffield Gardens, Kensington, London, W. Payments on account of the Club should be made to Messrs. Barclay & Co., Ltd., No. 1 Pall Mall East, S. W. March 1 is the date of annual renewal.

The Leipzig Kunsthistorischer Verlag (New York: Lemcke & Buechner) is just beginning issue of a 'Niederländisches Künstler-Lexikon,' based on research in the archives, and edited by Dr. Alfred von Wurzbach. It will record nearly 2,000 monograms. The work which it supplants, Nagler's, has in thirty years become quite antiquated. Biographies will be given of all Dutch and Flemish painters whose products have come down to us, with descriptions of their authentic works in public and private galleries, and of engravings after them. Painters, engravers, etchers, sculptors, medallionists, architects, even art patrons and collectors, will be looked after. The range is to the close of the last century. Two octavo volumes will result.

'Rubens,' by H. Knackfuss (Bielefeld and Leipzig: Velhagen & Klasing; New York: Lemcke & Buechner), is as fully illustrated as its companion "Monographs on Artists," and the text gives pretty much all that the average reader will care for in the way of biography, though it contains little either important or interesting as criticism. We are assured that the translation, by Louise M. Richter, has been revised by Mr. Hobart Cust, "so that, while retaining the meaning of the German original in its integrity, the differences in the two languages might be adequately overcome." The result is a rather less barbarous phraseology than that of some of its predecessors, but we are still staggered by such turns of speech as "a strong task [taste?] for soft and shining flesh-tints," or such words as "uncessantly" and "laying" for lying. Rubens's influence on "woodcarving" is spoken of on page 45 and again on page 159, where it would seem, from the context, that wood engraving is meant. In most cases the description of the illustrations is scrupulously exact, but a reproduction of an engraving after 'The Descent from the Cross" is erroneously stated to be "after a photograph from the original." In spite of such minor blemishes, the publication continues to be a useful one.

Mr. J. N. Larned's 'History of the United States' (Houghton, Mifflin & Co.) has a number of features that should commend it to teachers of secondary schools. The page is clear and open, and the paragraph and marginal headings fresh and apt. There are numerous sketch maps scattered through the text; the larger maps, sixteen in number, being grouped together at the beginning of the volume. The apparatus of topics and suggested readings appended to each chapter is, on the whole, the best we have happened to see. It is interesting to note that the author does not think "documents" too heavy for his purpose, but makes frequent references to them in his lists. The appendices summarizing the data about Presidential elections and listing important measures of the Federal Government are also well contrived. In some other respects the praise must be more qualified. One does not look for much originality in the choice of topics in an elementary textbook, and Mr. Larned does not in this particular wander far from the beaten track. One wonders, however, that half of the volume should be devoted to the period prior to 1789, and that the momentous events subsequent to 1865 should be disposed of in two short chapters of less than fifty pages, or about two-thirds of the space given to the Civil War. The style, too, is not impeccable, being often loose and inelegant. On the whole, however, the book is to be pronounced an important addition to the list of useful textbooks in American history for schools.

Arthur J. Burdick's 'The Mystic Mid-region: The Deserts of the Southwest' (G. P. Putnam's Sons), even without the very readable text, is captivating through its beautiful illustrations alone. They are, of course, all from excellent photographs, and exceedingly well chosen and adapted to the respective chapters. As the book makes no pretension to depth or exhaustiveness, an occasional slip or slight error should not be noted, still less censured. This is (what is not often the case with such publications) a modest book. The writer, who evidently has seen the great desert of the West with wide-awake eyes, eclipses his own personality and experiences by placing his subject in the foreground, and thus, quite involuntarily, indeed, excites the reader's curiosity to know more about him and his rambles in that region. Alive to the impressiveness of nature, he sees not only the incontestably picturesque in the appalling wastes he describes, but also a certain grain of poetry, without exaggerating it at the cost of truth. Much useful information of a general (and also specific) nature is disseminated in an agreeable manner through these pages. We are gradually introduced to the subject as it was and as it is, to learn finally what it is expected to become through the redeeming hand of man. This is logical arrangement. The chapters on the plants and animals of the desert are not only attractive, but useful; there is botany and some zoölogy, after that popular style which incites to study even without technical preparation. The plates are calculated to give living impressions of the forms they illustrate. The author has had the good taste not to crowd too much Indian on the reader, and still less does he burden the Indian with extravagant romance or poetry. Everything in this little volume is in its place and in proportion with the rest.

Mary Austin's 'The Land of Little Rain' (Houghton, Mifflin & Co.) consists of about fourteen sketches from the borders of the desert. They contain more poetry than de-

scription, although that poetry is not meant for fiction. Not unfrequently the poetic tendency casts a thin veil over the logic of the treatment, but on the whole it is harmless, and the book is readable for those not caring to learn too much. The illustrations are fair, though not always strictly in harmony with the subject. There is some really useful advice offered to tourists in the region. While this is partly a "desert book," most of the contents is devoted to the country bordering on the desert, and hence covers a ground rarely if ever trodden, and deserves commendation and attention.

Among the various anthologies published this season, prominent is Ernest Pertwee's 'The Reciter's Treasury of Verse, Serious and Humorous' (London: Routledge and Sonnenschein; New York: Dutton). It forms an openly and clearly printed volume of more than 800 pages; but 71 of these constitute a practical essay on the art of speaking. Grave and gay are mingled here without reason if not without rhyme, and the character of the selections as a whole cannot be discovered by index-learning, for there is no index. Some of the pieces are certainly ower lang. America is proportionately well represented — Hay, Leland, Holmes, Longfellow, the Lowells, Poe, John [*sic*] Whitcomb Riley, Charlotte Perkins Stetson, Bayard Taylor, Whittier, N. P. Willis, and yet others. Victor Hugo, Goethe, and Schiller enter by way of translations. The selection includes many standard poems fit for recitation, and some for which this quality much outweighs the literary.

As of songs, so it might be said of the cook-books of any country—let who will make the laws. The popular German work for housekeepers of Henriette Davidis has just been brought out in the original and in an English translation by C. N. Caspar Co., Milwaukee ('German National Cookery for American Kitchens'). It is not to be despised as a means of freshening and reinforcing our domestic dietary. The metric system is discarded in the weights and measures. Thirteen pages are devoted to displaying characteristic German dishes in a bilingual list, duly indexed; and there is a separate English-German vocabulary of culinary terms. The practical plates for joints, fish, etc., are reproduced.

President Nicholas Murray Butler's *Educational Review* has just been indexed analytically for its first twenty-five volumes (January, 1891, to May, 1903), by Mr. Charles Alexander Nelson of the Columbia University Library. Here under one alphabet will be found topics, articles, writers, authors of books reviewed, admirably presented for research; and, in view of the eminence and range of the contributors to the *Review*, it is needless to say that this index claims a place in every public, college and high-school library. The editor himself is naturally the fullest contributor, filling three of the double-columned pages; but President Eliot, as writer or occasion of writing, shines with half a page. Special attention should be called to the geographical rubrics —Connecticut (though it have but one item), England (one page), Massachusetts (three-quarters), New Jersey, New York (three pages plus), etc.

Mr. David W. Hoyt, Providence, R. I., sends us Part viii. (Part iii. of Volume ii.) of his 'Old Families of Salisbury and Amesbury, Mass.,' embracing the respective families of Knight, Littlefield, Pecker, Sanders, Sawyer, Sayer, Simmons, Titcomb, and Wheelwright, and several others. Friends' Meeting in Amesbury is also taken account of, and there are additions and corrections for Volume i., with a notable addendum for the Blaisdell family, and a page to the Rev. George Burroughs, one of the best known of those executed for witchcraft in 1692. This is a handsomely printed genealogy, and proceeds slowly according to public support.

A more than usually interesting volume by Prof. A. Gazier, entitled 'Mélanges de Littérature et d'Histoire' (Paris: Armand Colin), contains a number of studies of a totally unconventional character dealing with controverted points in lives and letters. For instance, Professor Gazier expresses new and pointed views on the real import and origin of "Tartufe," and seeks to explain naturally the long embargo on its performance. Again, the singular shiftiness of Fénelon while at Cambrai, and the still more inexplicable conduct of Massillon in consenting to consecrate Dubois as bishop, become intelligible enough in the light of the patient and ingenious analyses here given. Professor Gazier, like many another representative of modern historical method, seems somewhat disposed to look askance at any judgment that claims prescription from attack. The last essay revives the vexed question of spelling, and takes a moderate position in favor of slow and judicious reform.

In 'La Méthode des Classiques Français' (Paris: Armand Colin) M. Paul Desjardins seeks to point out and prove that, in strictly classical work, the course of intellectual invention or development remains fundamentally the same, whatever may be the field or the material in which the artist works. In support of this thesis (which should have called for something less summary than a prefatory note) we are offered a review of Pierre Corneille, Nicolas Poussin, and Pascal, as typical of the spirit and method described, namely, the disposition to subject movements of mind or soul to the controlling influence of reason and the conception of *ordonnance*. While the idea is not new, the collocation of names certainly is; and here we venture to doubt the soundness of the theory, for unless (with M. Desjardins) we think only of the Pascal of 'Les Provinciales,' we surely cannot forget the passionate appeal of the 'Pensées': "Le cœur a ses raisons que la raison ne connaît point."

From Ernest Leroux, 28 Rue Bonaparte, Paris, we have the first fascicle of the new "Bulletin de la Société Française de Fouilles Archéologiques." The foundation of this society dates from January 14 of the present year, and the Bulletin officially records the steps towards it, and the subsequent proceedings, membership, etc. There follows a lecture on the excavations at Susa and on Persian antiquities in general, delivered by M. Louis Watelin on March 18. The Society will promote research and bestow on French museums the objects found.

The educational policy of the Indian Government, as set forth by Lord Curzon in a state document, just published, is one which will commend itself to all who are interested in the education on Western lines of Eastern peoples. It is founded on the experience of just half a century, for it was in 1854 that the directors of the East India Company accepted the systematic promotion of general education as one of the duties of the State. The main end for many years of the system then instituted was to create a class of intelligent and efficient Government servants, and primary education was neglected. The fundamental importance of this is now fully recognized, and the support of village schools is henceforth to be made a leading charge upon provincial and local revenues. Instruction is to be wholly in the vernacular up to the age of thirteen, and will not be completely abandoned at any time. But in primary education "English has no place, and should have no place," are the viceroy's emphatic words. The system of university education is to be modified so that it is hoped that it will no longer tend to accentuate the defects of the Indian intellect—the disproportionate development of memory, the incapacity to observe and appreciate facts, and the taste for metaphysical distinctions. Industrial, commercial, and, above all, agricultural training are to be prominent features of the new policy. Not only are textbooks on agriculture in the vernacular to be provided, but the Government proposes to establish an Imperial Agricultural College with an experimental farm and research laboratory. Female education will be promoted by establishing model primary girls' schools in important centres.

The report of the Moseley Educational Commission is prefaced by a brief statement signed by all the commissioners, summarizing the conclusions upon which they are all agreed. They remark upon the absolute belief in the value of education prevailing in this country; on "the spirit that animates both teachers and pupils"; on the close connection between theory and practice, and the important part assigned to manual training; on the liberal expenditure, both public and private; on the absence of any religious difficulty, which materially facilitates the work of the schools, and on the high esteem in which the services of experts in various branches of knowledge are held. They believe that in America education is universally regarded as fundamental to democratic civilization, or, as President Roosevelt told them, "education will not save a nation, but no nation can be saved without education." All the commissioners, with three exceptions, have submitted individual reports, nearly all of which deal with the general features of American education. Some have specialized, as, for example, Drs. Bradford and Gaskell on medical education, Professor Ayrton on electrical engineering, Mr. Barclay on commercial education, Mr. Groser on legal education, and Mr. Spender on truant and reformatory schools. A general conclusion drawn from the reports by a writer in the London *Times* is, "that there is yet nothing like finality in American educational institutions, any more than in our own. They, like us, are feeling their way along more or less untried ground; with greater energy, perhaps, and more freedom of experiment, as differences in national character and outlook, or the absence of old traditions, class distinctions, and religious difficulties, have smoothed the path of reform. The educational awakening that is beginning here has come earlier in them, and is being followed up more quickly."

The Imperial Cabinet of the Government of

Japan has issued the twenty-second volume of its statistical Annual, which bears date of 1904, and, in the French language, contains statistics on multifarious subjects to the end of 1902, though those relating to post, telegraphs, transportation, and commerce are for the most part brought down to the end of March, 1903. Under eighteen divisions, beginning with territory and population, and ramifying through all the departments of executive Government business, closing with finance and political administration, there are set before the student carefully digested and tabulated details of administration. Notable additions to previous issues are seen in the pages devoted to Formosa, which in 1901 showed a resident population of 2,750,956, besides over half a million transients. The newly modelled city of Taipeh (Japanese Daihoku), which in drainage, cleanliness, hygiene, and general standard of civilization is the model for the whole island, contained 49,799 souls, being the first of the eight cities in the island having each over 10,000 people (five of these having 20,000). The vital statistics regarding marriage, divorce, birth, and death of the Formosans show that illegitimacy is probably not greater in the new part than in the old part of Japan. Migration to Yezo and the northern islands continues to be brisk (43,401 in 1902), and apparently four-fifths remain as permanent residents in this new, promising part of the empire. The fertile and well-watered valley of Ishikari Province, containing the mineral riches and the capital, leads in population. The worthless Kurile Islands, with which Russia compelled Japan to content herself in place of Saghalien, show that, of 621 immigrants thither, 539 came away. Even the Ainos, those gentle and degraded savages, now come under the statistician's notice, reckoning a total population of 17,374. Instead of their dying out, as the theorists would have them, births show an increase of more than fifty per cent. over deaths. On the 31st of December, 1902, there were 8,043 Chinese, 2,223 British, 1,640 Americans, 662 Germans, 519 French, and 236 Koreans in Japan, while, in addition to the laborers, students, and travellers already abroad, 32,900 received passports (5,457 for China, 4,354 for Russia, 5,096 for the United States, and 11,457 for Hawaii).

—The Baker & Taylor Co. publish a third volume, 'The Congregationalists,' by the Rev. Leonard W. Bacon, in their series, "The Story of the Churches." It does not compare in fulness with Prof. Williston Walker's 'Congregationalists,' but, designed as a brief popular history, its choice of matter and its manner of treatment adapt it admirably to the end in view. There is no attempt to trace the sources of American Congregationalism back to European soil, but nearly every striking aspect of the American development has its appropriate word. An exception is the scant mention of Roger Williams; and Wheelwright and Mrs. Hutchinson are dismissed too cavalierly as "wilful and insolent mischief-makers." An excellent summary is given of the Cambridge Platform of 1648, followed by an estimate of the amount of subsequent deflection from its principles. There is a good and sympathetic account of the Half-Way Covenant—a bone of contention which invites perennial exhumation. A chapter on the Great Awakening steers a middle course between the "deplorable excesses" of the revivalists and the "beneficent work" of their hands. Whitefield's vanity and violence are called by their right names. Jonathan Edwards and those carrying on the elaboration of the New England theology have a chapter, "Growth of Doctrine," but it is evident that Mr. Bacon thinks their refinements would be wasted on the readers whom he has in mind. Three chapters, "Disruption," "Unitarianism," and "After the Disruption," are related to different stages of the Unitarian development and separation. The temper of these chapters is irenical. The Unitarian will be less likely to complain of them than the orthodox Congregationalist. The imputations of the orthodox writers who brought on the controversy are described as "unjust and outrageous." It was the orthodox party, we are told, that departed from Congregational principles. Of these principles Mr. Bacon is a consistent advocate, and by no means a mere apologist for the concrete Congregational development into "a rigidly hardened sectarian mould." There is complete misapprehension of what was called the "Western Issue" among Unitarians, and it is difficult to understand how Emerson's letter to Henry Ware, jr., in 1838, is read as "exasperatingly flippant." In the "Public Reforms" chapter, Mr. Bacon's filial attraction to the form of anti-slavery doctrine represented by his father is simply the expected note. Channing and Bacon are bracketed as like-minded; but Channing was an early convert to Garrison's anti-colonization doctrine, whereas Bacon was the chief protagonist of colonization so long as any one remained to do it reverence.

—Mr. Charles M. Andrews's 'History of England' (Boston: Allyn & Bacon) is a convenient handbook of less than six hundred pages, covering the period from the earliest times down to the accession of the present King. It is mainly a political outline, though a good deal of the social, industrial, religious, and literary history of the English people is narrated or referred to in such a way as to put the student on the right track. It is intended as a textbook for American schools and colleges, and ought to answer this purpose very well. No doubt the author does not expect to be followed implicitly. In his account of the Boer war he uses the phrase "British suzerainty," does not refer to the compact of 1881, nor to the trial and conviction of Jameson in England; nor does he describe the nature of the "grievances" which led to the war. There is a total omission, too, to emphasize Mr. Chamberlain's connection with those events, which was certainly important. In the same way, in discussing the causes of the American war, he says, as to "no taxation without representation," that it is hard to see what good would have been done "by a few men elected in the colonies and sent three thousand miles to sit in a Parliament that was thoroughly corrupt, and represented no one except the men who bought the votes of the electors." What the colonies wanted to do was not to be represented in Parliament, but to vote the money themselves as they had been accustomed to do. "No taxation without representation" was merely another form of what appears in the Declaration of Independence as: "He [the King] has combined with others [the Parliament] to subject us to a jurisdiction foreign to our constitution and unacknowledged by our laws; giving his assent to their acts of pretended legislation . . . *for imposing taxes on us without our consent.*" This was no cry of "excitable colonial orators" (p. 460), but the solemn declaration of Jefferson, Franklin, Roger Sherman, Samuel Adams, John Adams, and fifty others of the most able and learned Americans then living, made to justify their rebellion in the eyes of the civilized world and of posterity, and with the full knowledge that, if they could not make their position good, they would pay the penalty with their lives.

—There are great advantages in learning any mathematical theory which is subsequently often to be applied, from a logical syllabus expounded in lectures. The propositions should be numbered in the syllabus in one series, from beginning to the end; and propositions very frequently employed in the proofs should have, besides, brief names. Then, in the case of a corollarial proof—that is, one not requiring the introduction of any subsidiary lines or quantities—mere references to the numbers of the premises, sometimes with the number of times each is to be applied, will generally suffice. In case this is not enough, brief indications of how those premises whose application is not quite obvious are to be applied may be added. Theorematic proofs—that is, such as depend upon some ingenious addition to the conditions of the proposition to be proved—will require this addition to be stated; after which the proof becomes corollarial, and should be treated like any other corollarial proof. The student having become perfectly familiar with the arrangement and general contents of such a syllabus, by working through it, will ever after find it an invaluable work of reference, in which any result may be found directly, together with the logic of it in a nutshell. Dr. A. Clement Jones's 'Notes on Analytical Geometry: An Appendix' (Oxford: Clarendon Press; New York: Henry Frowde) approaches to being such a syllabus in a duodecimo of 172 pages, of which 30 are occupied with examples and hints for their solution, with a perspicuous one-page index. The work is confined to plane curves of the first two orders, together with unicursal cubics, the whole treated from the metrical point of view, with Cartesian coördinates and occasional references to polar coördinates. The most serious omission is the problem of two conics without contact, with single contact of 2, 3, or 4 points, and with double contact, which is often wanted and is not very readily worked out. A better book of the same sort might be made; but, as it is, Dr. Jones's 'Appendix' will prove a lifelong blessing to many a student.

—About half of volume xii. of 'The Philippine Islands, 1493-1898' (Cleveland: The Arthur H. Clark Co.), is occupied with the first English translation ever published of the 'Relación de las Islas Filipinas,' written by Padre Chirino, a Jesuit, and published at Rome in 1604, one of the most valuable sources for the early history of the Philippines under Spain. This relation is to be completed in the succeeding volume of the series, and shall be considered as a whole in connection with that volume. The first half of volume xii. contains various

documents of 1602 and 1603, referring to the depredations of the Moro pirates, to the perennial contest between friars and laymen, to the restrictions on trade with Spain, America, and China, and to the desirability of expelling the Chinese, especially after the revolt of the latter in Manila in 1603. We note how the desire to aid the Portuguese in conquest in the Moluccas led to the abandonment for a year or two of the work of making good the Spanish assertion of authority in the Moro regions of the Philippines; this is only one of the earlier instances of Spain's vacillating policy in dealing with the Moros, and it was promptly paid for by the renewed activity of the Moro pirates in scourging the coasts of the central islands of the Philippine group.

—Just now, when Senators and Representatives at Washington are showing a tendency to adopt toward the Philippines the old restrictive trade policies of the colonizing nations of two and three centuries ago, it would be worth while for these gentlemen to turn back and read Philippine history in the light of such documents referring to Spain's policy in the archipelago as are contained in volume xii. and as will appear in succeeding volumes of this work. They will find that all concerned in the question—the Spaniards in Spain, the Spaniards in the Philippines, and the Spaniards in Peru or Mexico—assumed of course that mediæval trade and navigation restrictions would be imposed, but all labored to the end that the other fellow's ox might be gored; if our legislators will then trace the workings of this policy down through the eighteenth and into the nineteenth century, especially to the extent of ascertaining what the foreign travellers in the Philippines had to say about the results of this policy of shutting up the Phillipines for fear some other people might develop them or do them some good, they will not need to recall American colonial history to guide them in their deliberations. Another difficulty which Spain early encountered in the islands is indicated by this statement in the letter of the provincial of the Dominicans in 1603: "One of the auditors of these islands told me years ago that the judges in Castilla ordinarily performed their duties well because they were seeking honor, but that in the Indies it was the reverse, and that what the judges seek is to enrich themselves." Among the friars themselves, all was not going well, in 1603; the provincial of the Augustinians is asking the King to send out some strict inspectors, to restore the discipline which he laments as having been lost in his order.

—The 'Jewish Encyclopædia' moves steadily on its way, and the sixth volume (God—Istria) is as full of variegated lore as ever, and contains several rubrics of more than Hebrew interest. Thus, the "Golem," the Jewish *homunculus*, a somewhat unscientifically constructed Frankenstein, vivified by a "shem" or wonder-working name of God inserted in its mouth, sometimes played a part like the magician's broomstick which was only too industrious in its labors. But the article makes no mention of the grotesquely horrible use of this idea by Achim von Arnim in his 'Isabella von Aegypten,' known now best, perhaps, through Heine's 'Romantische Schule' (iii., 2). Another equally interesting article is on the queer Aramaic nursery rhyme, *Had Gadya*, "A kid, a kid," with its analogies to the "House that Jack Built." A musical setting of an English version is also given and a very full bibliography, but the article itself might have been made clearer. In history a long and very able account of the Inquisition (16 pages) easily leads for interest and importance. As before, biography is strongest of all, and demands by far the most space; in this volume we have the outstanding families of Goldsmid and Hirsch in their association with agricultural colonies and the Hirsch Fund. Biblical rubrics of importance are few; Dr. Cheyne has six pages to set forth his very latest views on Isaiah. On Muslim matters we are given almost more. Goldziher treats admirably "Islam" and "Hadith" in relation to Judaism, and there is an exceptionally full (5 pages) and able account of Ibn Gabirol, whose blood was Jewish, but whose philosophical ties were all with Islam. Another strange kinship was that of Immanuel b. Solomon, the friend of Dante, and poet in Hebrew and Italian, with a range from an imitation of the 'Divina Commedia' to caustic satire, bold eroticism, and even a flippancy which has brought his verses under the ban—a somewhat limited, jerkily pious Heine. Another has had unwitting contact with East and West since his death. Of the first-century scholar, but above all miracle-worker, Hanina b. Dosa, tales are told which have passed into the 'Arabian Nights' and become part of popular hagiology. This was first worked out by Perles in his 'Rabbinische Agada's in 1001 Nacht,' and attention has again been called to it by Chauvin in his 'Recension Égyptienne des 1001 Nuits.' These references must be added to the scanty bibliography given here. An especially valuable article with an elaborate tabulated list treats Jewish Incunabula. Another, still more elaborate, is that by Bacher on the history of Hebrew Grammar (13 pages). Yet in details it is open to criticism. Samuel Lee's grammar (1827) was worthy of more special notice for the scientific advance which it marked. Davidson's 'Introductory Hebrew Grammar' appeared first in 1874—the 1894 edition was the eleventh—and was a pioneer in its class. In 1882, Robertson's translation of Müller's 'Syntax' appeared, and has since gone through several editions. Finally, in the minds of some of its contributors the conception of this work as a general encyclopædia evidently still clings fast. So they give us the information, "India: an extensive region of southern Asia"; "Ireland: an island west of Great Britain." But such things are now so few that they come in with a merely humorous effect; the encyclopædia, as a whole, has found its garden and is cultivating it diligently.

SANDYS'S HISTORY OF CLASSICAL SCHOLARSHIP.

A History of Classical Scholarship, from the Sixth Century B. C. to the End of the Middle Ages. By John Edwin Sandys, Litt.D. Cambridge (Eng.) University Press; New York: Macmillan. 1903.

Dr. Sandys long ago won honorable standing as a classical scholar. His excellent edition of the 'Orator' of Cicero appeared nearly twenty years ago, and he had previously done able service as editor of the "Bacchæ" of Euripides and of the posthumous commentary of E. M. Cope on the 'Rhetoric' of Aristotle. One would naturally look, therefore, for something of value from him on such a subject as the History of Classical Scholarship, and there is doubtless a point of view from which such an expectation will be fairly satisfied. We cannot but feel, however, that a good opportunity has been sacrificed.

For the purpose of his book, Dr. Sandys defines Classical Scholarship as "the accurate study of the language, literature, and art of Greece and Rome, and of all that they teach us as to the nature and the history of man." Of course, no work of one or two volumes could exhaust all that might reasonably be said within the limits of so ample a definition. Greece and Rome have entered so deeply into the history and nature of man that the problem of an author working under such a definition must be simply one of determining what small fraction to select from the mass of material that might possibly be utilized. Now Dr. Sandys has chosen so to burden his book with comparatively unimportant facts as to crowd out any adequate consideration of the real meaning of Greece and Rome to the history of human progress. Too large a portion of the book is fairly represented by page 421, in which we learn that early in the fourteenth century the monk Sophonias wrote paraphrases of certain works of Aristotle, valuable chiefly for their excerpts from earlier commentaries; that the metropolitan of Mytilene, Leon Magentinus, wrote scholia on the 'Organon'; that the rhetorician and grammarian, John Glykys, wrote a Syntax more remarkable for its lucidity than for its learning; that John Pediasimus, professor of philosophy at Constantinople, produced scholia on Hesiod and Theocritus, and that Manuel Chrysoloras played a leading part in the revival of Greek learning in Italy. Only one of these men is mentioned elsewhere in the volume, and then not in such a way as to bring him into any vital relation to the subject in hand. To know a multitude of such facts with reference to any given period is one thing; to know the general characteristics of that period, and the part of classical study and tradition in determining those characteristics, is quite another thing. To make some contribution to knowledge of this second sort would have been of far more service to the cause of classical scholarship.

No possible effort of human scholarship could accumulate such a mass of detail without the intrusion of many errors, but we may assume that Dr. Sandys has been fairly careful. In a few cases, however, he has tripped where one would least have expected it. In the few lines given to Asinius Pollio he notes Pollio's severe criticism of Sallust, and adds: "On the other hand, he expressed a very high opinion of Cicero," quoting a well-known passage preserved in the 'Suasoriæ' of the elder Seneca. Now the hostility of Pollio to Cicero in matters literary was notorious. Only two pages from the passage quoted by Dr. Sandys, Seneca relates the amusing incident of Pollio's abrupt departure from the house of Messala Corvinus because a too enthusiastic poet had been allowed to bewail the death of Cicero and the consequent silence of the Latin tongue. Seneca says that Pollio remained

to the end most hostile to the fame of Cicero. After his death his son, Asinius Gallus, wrote a voluminous work to prove his father's superiority over Cicero, and this was answered by Claudius. Of Cicero's famous remark to his brother concerning Lucretius, Dr. Sandys says: "It is disappointing to find in Cicero so vague a criticism of the merits of a poet who had done him the honor of studying and imitating his own translation of Aratus." Saintsbury also makes the passage alluded to the basis of severe treatment of Cicero as a critic. Both are entirely unfair in their use of Cicero's words. In replying to a letter from his brother, he incidentally quoted an opinion which his brother had expressed, and gave his assent. It was a mere afterthought at the close of a letter dealing with matters personal and political, not literary, and Cicero was under no obligation to say more.

It is far wide of the mark to say that "literature before and after Cicero had comparatively little attraction for Quintilian." One can hardly imagine how Quintilian's treatment of Virgil, Horace, and Livy, though comparatively brief, could have left Dr. Sandys with such an impression. If any one thing is evident from Quintilian's great work it is that he was an earnest and intelligent reader in a very broad field of both Greek and Latin literature. Coming down to a later period, the treatment of Roswitha of Gandersheim, that interesting gleam of feminine culture from the tenth-century darkness of Saxony, is far from satisfactory. It is not correct to say that her dramas were written in actual prose. It might be easy enough to prove that they do not satisfy any adequate definition of poetry, but she herself doubtless regarded the form as poetic. "Reimprosa," "halbpoetische und halbprosaische," "ein Mittelding zwischen beiden," are some of the terms rightly applied to her work by Barack, in his edition of 1858. Nor is it putting a correct interpretation either upon her own words or upon the facts to say that she was a close imitator of Terence. She felt scandalized that men who were otherwise good Catholics should allow themselves to be stained with a knowledge of wicked things through their delight in the sweetness of expression found in the plays of Terence. Accordingly she sought, in dramatic form, to substitute the *laudabilis sacrarum castimonia virginum* for the *turpia lascivarum incesta feminarum* of the Roman poet. Close imitation did not suit her purpose, and does not appear in her work. From what we know of her, we may well doubt whether she ever applied her own mind closely to the study of that which she regarded as defiling to the minds of those about her. Dr. Sandys might well have given us a careful study of the genesis of so fair a flower in the apparently forbidding literary soil of the Saxony of the tenth century.

The custom of author's readings previous to publication, instituted by Asinius Pollio and so prominent a feature of the following century, certainly deserves some mention in a history of classical scholarship. The relation of the policy of Augustus to the plea of Horace for the literature of his own day, as opposed to that of the old republic, is another interesting question not raised by Dr. Sandys. Still another is the motive and effect of the assault upon the Ciceronian style by Pollio, the younger Seneca, and their followers. The statement that the earliest writers of Latin literature were not born in Rome, suggests a false inference as to later writers. Will the author name a few really important writers in any period of Roman classical literature who were born in the city?

It was doubtless a mere oversight that the name of Richard Volkmann is omitted from the selection of important authorities enumerated at the head of the chapter on the 'Rise of Rhetoric and the Study of Prose.' Volkmann is more widely used in recent years, either in separate form or as condensed in Müller's 'Handbuch,' than any of the authorities named. The slips of the type-setter have not been entirely worked out. A number of cases in which B. C. has usurped the place of A. D. will give no serious trouble, as the discrepancy is too great to go unnoticed.

We should have been glad to see in this book a work which would have been a source of strength to classical scholarship at a time when it is fighting a hard battle against misconceptions as to its real nature and utility. We cannot avoid the impression that a dip into this book will have directly the opposite effect upon any mind not already definitely anchored on the classical side. The mass of facts that Dr. Sandys has accumulated, with a labor of which few can have any adequate idea, were well worth getting together in accessible form; but they ought not to be called a History of Classical Scholarship. Dr. Sandys found himself unable to bring his subject beyond the year 1350 in this volume, and a second will follow.

MORE NOVELS.

The Picaroons. By Gelett Burgess and Will Irwin. McClure, Phillips & Co.

The Wood-Carver of 'Lympus. By M. E. Waller. Little, Brown & Co.

High Noon. By Alice Brown. Boston: Houghton, Mifflin & Co.

Messrs. Burgess and Irwin model their 'Picaroons' on the picaresque tales of early seventeenth-century Spanish literature that "dealt with the fortunes of beggars, impostors, thieves, etc., and chronicled the Romance of Roguery." The translation of similar themes into modern San Franciscan,—picturing dissipated reprobates from Harvard College to the Philippines, misdemeanors from shanghai-ing to opium-smuggling, worded in slang of the latest devices from college to cockney—makes a compound that we should rather call the very Roguery of Romance. Probably the modern shady loafer has never been more minutely or ingeniously portrayed. The racetrack, the Chinese lottery, the Spiritual-medium cabinet, the Turkish bath lend their aid to the local mud. Full details are furnished of all modern sorts of trickery and fraud served in the most technical tongue of the professional hobo. We can remember no tale of mere blood and thunder that would not seem refined after this banquet of those unpicturesque vices, drinking and cheating. The often inventive and occasionally amusing flash of story and vocabulary only makes the matter more deplorable. A few such books would suffice to send the public to reading their old "Lady's Annuals" and "Bride's Keepsakes" with avidity.

Pleasantly disinfecting is it to turn to 'The Wood-Carver of 'Lympus,' a story of the Green Mountains, and to breathe mountain air geographically and spiritually. Far up among the hills lived a man crippled by a falling log in the very flush and prime of his youth. Here he despaired and blasphemed till salvation came to him in the form of a friend bringing the opportunity to work. The work brings yet other friends, and a drama weaves itself about the invalid's cot with mountains for the everlasting witnesses, and the seasons ringing their changes at the windows. There are excellent pictures of farm life, and there are good portraits of genuine Vermonters of stage-coach days. Uncle Shim and Aunt Lize well illustrate the kindly shiftless and the kindly capable. There is a Twiddie who, in the early chapters, swings her bare legs from a butternut branch and rushes about like a young calf, and who grows up before the reader into a thing of delight in her engaging naturalness. There is Hugh the Cripple, who finds his own life in his work, and gives back life abundantly to others in example of pluck and the counsels of a hard-won wisdom. There are the friends from the outer world beyond the mountains, the *deus ex machina*, who suggested to Hugh the woodcarving; there are the woman and the geologist—all bringing gifts of help, mental and moral, to the cripple, changing his life for all time. It is a story of high thinking, wholesome living, and withal of an interest that holds to the end. In gratitude for these traits one can well forget a sentimental touch here, a vagueness there, and certain final disposings, the which to particularize here would be "going into the treachery of reasons."

Alice Brown's stories should be read singly if the mind is to be left detached enough for proper appreciation. So taken, they are well worth weighing and analyzing. In bulk they overtax the reader with a sense of preciosity, of differentiation to the *n*th power, of complication of the complex, of life in a microscope, of emotions first wire-drawn and then split, of the eternal feminine tiptoeing down the ages, her own soul in her hand, searching for new quintessences of herself as Henry James searches for the right word. Read one at a time, and pondered over, they fill one with an almost breathless perception of the writer's clear vision into human relations—a vision that sees straight and around corners as well. We are struck, too, by a mystical tendency that loves to hover near the supernatural, serene and unafraid; then, when we have caught the breath again, we can at leisure approve the originality of conveyance for each emotional message. For that is what the stories resolve themselves into. Alice Brown is the Mary Wilkins of the superfine emotions. The one is no more morbid than the other in the matter of treatment. If Alice Brown's topics are more deeply sentimental and her pen dipped in esoterics, at least she dries her weeping pages with a dash of bright, warm humor, straight from some very sunny clime. What there is of morbid is to be found in the eternal ladies themselves; in her who is deeply hurt at being called "a reasonable woman"; in her—the heroine of one of the most charming of the stories—the old gentlewoman who passed her life in an agony of unspoken jealousy of a supposed early affinity of her husband. How delightful, by

the way, is the Diana of this story!—the niece made up of divine tenderness and bubble-pricking fun. Chief among the self-torturers is the Margaret of "The Map of the Country," who more than all out-womans woman in prophesying to her lover on the eve of their wedding the tangles to be—telling how his soul will alter, what she ought to do and knows she shall not do, what her soul will do and what the Almighty will be asked to do, and what other souls have done; after all which prescience and reminiscence a humorous burst of her lack of humor closes the scene. The vivisection and comparative history of man's and woman's wedded love thus go forward in these tales and in a thousand others less clever than Alice Brown's. What might not a story-teller deserve of the public should he write of the woman who merely goes on being a woman without specialized thinking about it—the woman who in mellow years considers young ways of worship from her lord as retrogression?

Architecture and Other Arts. By Howard Crosby Butler, A.M., (Part II. of the Publications of an American archæological expedition to Syria in 1899-1900 under the patronage of V. Everit Macy, Clarence M. Hyde, B. Talbot B. Hyde, and I. N. Phelps Stokes). The Century Co. 1903. Pp. xxv, 433.

The prospectus of this work of five volumes announces that Part I., by Robert Garrett, will be ready in 1904 and will be devoted to the topography and itinerary, and that the parts numbered respectively III., IV., and V. will also appear during the present year, and will be devoted to Greek and Latin inscriptions, Semitic inscriptions, and anthropology. The volume before us, in a solid buckram cover, makes a beautiful "quarto," which the old-fashioned classifier of books would be apt to call a small folio. The number of the illustrations is not stated anywhere, but, as the table of these fills eleven pages with about fifty-five entries to a page, it will be seen that the number is very great. They are, in small part, plans of churches, villas, and the like, taken from the book by the Count de Vogüé, well known as 'La Syrie Centrale,' and published in 1877; the majority of the remainder are half-tones, very clear and very well printed, from photographs carefully selected from a great block of six hundred and more brought home by the expedition. Under the conditions, with difficulties of travel, of heat and dust, of burning sunshine, of exposure, of packing, of transportation, the prints are surprisingly good. A full-page plate is devoted to a conjectural restoration of the temple at Burdj Bakirha, a Roman tetrastyle; and there are also a few such restorations in the pages of the book, such as the very interesting one (p. 364) of the outermost gateway at Si' in the Djebel-Hauran.

The region covered by the exploration is rather carefully indicated and described by the author, except that he has not allowed himself to refer to latitudes and longitudes, making it difficult to place his localities except by the aid of a map of unusual quality and of very large scale. Part I., indeed, is to contain a general map of Syria based upon Kiepert's, published in 1899, and several detailed maps on a very large scale, proofs of which are before us. The Orontes runs from south to north, never more than forty miles distant from the coast, until, after a course of 250 miles from its springs near the ruins of Baalbek, it turns westward to run past Antioch to the sea. Just east of the north and south stretch of the river, and between Antioch and Aleppo, lies the range of mountains known as Djebel il-A'la; and just east of that again a valley, and then another range called by Mr. Butler Djebel-Barisha. South of this lies a much lower tract, which may be taken as extending from lat. 35° 30′ to lat. 35°—that is to say, it is thirty odd miles broad, north and south, and much longer east and west. Those two districts form what is called in this book "Northern Central Syria," although the most eastern district, Djebel el-Hass, lying south of Aleppo, is sometimes considered apart. Far away to the southward lies Djebel-Hauran, and there again the explorations are taken up.

Nearly all the country explored is mountainous, and nearly everywhere the mountains are denuded of earth, and exhibit as barren declivities of rock as do the mountains of Greece. A picture for the express purpose of showing the aspect of this barren wilderness is inserted at page 6 of Chapter I., which deals in a convincing manner with the question of the deforesting and the consequent disappearance of the soil. It will not be necessary to be more lenient to Turkish rule in admitting with Mr. Butler that the beginning of the destruction of the country by the uneconomical use of its forests antedates that rule, and that abandonment was already well advanced in the seventh century. He finds also a partial cause for the deforestation in the building of the late Roman period, the peaceful and prosperous and architecturally ambitious days between the reign of Vespasian (for instance) and the ruinous invasions of the Saracens. After so many centuries of desolation, the buildings are found almost perfect, except for their wooden roofs and floors, wherever they have been preserved by that same desolation; for, where some slight reawakened prosperity has brought a larger local population and more enterprise, hope, and activity, the stones of the Romano-Syrian monuments are disappearing one by one, broken up for the humble buildings of the people, their pavements, their ovens, their bounding walls, and even burnt into lime for mortar.

The term "Romano-Syrian" would not be accepted by our author, and he has good reasons for his assertion that the character of the work is fully as much Greek as Roman. It is a little too sweeping a statement, which we find on page 20 and thereafter, that Roman vaulted building was of massive structure, with stone bedded in mortar, and that, as these Syrian buildings are vaulted as well as walled with hewn stone, they are, on this account, non-Roman. The Romans knew also arcuated building with blocks of stone, set dry, without cement of any kind, as is evident enough in such towns as Nîmes, in the theatre of Marcellus, and the great amphitheatres of Rome and elsewhere, and thousands of aqueducts and bridges; and, of course, in Africa and Spain, as noticeably as in Syria. At the same time we sympathize with Mr. Butler's wish that a term could be compounded out of "Greek" exactly as Romanesque has been made out of "Roman." Why not Hellenesque? But the term Greco-Syrian is suggested; and in the same connection (page 21) it is pointed out with perfect propriety that this Syrian style of building in great blocks of fairly hewn stone "may more properly be called *post-classical Greek* than Romanesque." This discussion, by the way, is not absolutely novel, because no student of De Vogüé's book, named above, which was published nearly forty years ago, can have failed to consider the subject very much from the same point of view.

In the lands east of the Mediterranean are a vast number of buildings so little injured that they are recognizable in all their parts, so that, with a certain amount of study and "constructive imagination," the plan of a dwelling-house or of a church can be restored with great completeness. Their discovery changed the whole aspect of Roman and Romanesque architecture for the world of students. A third and quite important class was added to the too familiar and often-contrasted styles, viz.: those of Western Europe (Romanesque) and of the Balkan Peninsula, and the cities of Syria (Byzantine). It is not now our business to inquire how far the discoveries in Africa, still more recent, form a fourth term in the comparison, and how far they are to be classed with the ruins of Syria as expressing an outlying or provincial style common to all the stone-producing countries of the great empire.

The work of this American expedition has been largely that of following up De Vogüé and his draughtsmen, with the threefold purpose of comparing his accounts and plates with the actual ruins, of completing his record by means of photographs, and, of course, of extending it where occasion might serve by new discoveries in the same line of research. With great frankness it is confessed that but little entirely novel was found; that is to say, few wholly unexplored sites were examined. On the other hand, many sites were discovered by De Vogüé in which there remained buildings of great interest as yet unpublished. And so the record is made up. For the rest, let it be said that the book from end to end is consistent and homogeneous. Building after building is carefully explored. There was no time, as it seems, for the making of many new plans, nor was there money for digging, even on sites evidently important as places for research. The camera and the careful annotations of the author had to do the work. It is not stated how far a more complete study, spade in hand, would be likely to reveal much important information about the buildings, their purpose, and their history. The best has been made of the opportunities offered, and the book is the most important contribution to architectural study since the publication of Choisy's 'Histoire de l'Architecture' in 1899.

The Life of John Colborne, Field-Marshal Lord Seaton, Compiled from his Letters, Records of his Conversations, and Other Sources. By G. C. Moore Smith. E. P. Dutton & Co. 1903.

All who love to read the life of a good soldier who was also a good civil governor, and, above all, a good man, will enjoy this record of the career of Lord Seaton, better known during the greater part of it as Sir

John Colborne. He was born of parents of the middle class in 1778, educated at Winchester School, and at the age of sixteen received, through the interest of the Earl of Warwick, an ensigncy in the Twentieth Regiment of Foot, but did not join it until two years later. "I remember," said he, "when I first joined, my colonel, when speaking to me, pointed to an officer, and said: 'There, sir, that officer was shot through the body and was all the better for it; there's encouragement for you,'" It seems, indeed, to have been the right sort to suit Colborne, for from that time he owed nothing to patronage, but every step which he gained was won either by hard fighting in the field or by hard work as an administrator.

In his first campaign, the unfortunate expedition to Holland under the Duke of York in 1799, he was twice wounded and was brevetted captain. Next he served in Minorca, Egypt, Malta, and Italy. While in Italy he met an American sea captain—name not given, but the man described as the ugliest he ever saw—of whom he says: "He gave a ball at Naples and borrowed a beautiful band, and, after the ball was over, he sailed away and took the band off to America, as a present to the President. For this he was dismissed the service." But what, we wonder, became of the band? During the last year of this period of Colborne's foreign service he acted in Sicily as the military secretary of Sir John Moore, for whom he acquired "a devotion which lasted beyond the dark hour of Corunna and became the inspiration of his life." Thus, in 1809, we find him in the Peninsula as a major and military secretary again to Moore, accompanying him in the short and fatal campaign, standing by his noble deathbed, and one of those who buried him next morning "on a bastion at Corunna." The rest of that year was spent chiefly in London, settling the accounts of the expedition and warmly defending his late general's military reputation, which, as Colborne held, "was basely sacrificed to party spirit," against the attacks which were made upon it. We are given many interesting letters and memoranda relating to this time, which should be useful to the historian.

Hence it was not until April, 1810, that Colborne returned to the Peninsula and began his service under Wellington, soon afterwards becoming lieutenant-colonel of the Sixty-sixth and later of the Fifty-second, which remained the regiment of his love. Gen. Beresford had said to Wellington: "I recommend you to employ Colborne; he is equal to anything"—and so indeed he proved to be. Constantly employed either in battle or in posts of the most arduous duty and responsibility, he was at length very seriously wounded in the assault on Ciudad Rodrigo, but struggled on in the charge until the fortress fell. Invalided to England, he was on his back for ten months, since more than a year passed after the battle before the surgeons could extract the ball from his shoulder. Sir Harry Smith writes: "The pain Colborne suffered in the extraction of the ball was more even than his iron heart could bear. He used to lay his watch on the table and allow the surgeons five minutes' exertions at a time, and they were three or four days before they wrenched the bone [ball?] from its ossified bed." This was in April, 1813. In June he was married to Miss Elizabeth Yonge, called "the Beauty of Devonshire," and a month later he went out again to the Peninsula. He served with the army until the first fall of Napoleon, winning particular distinction, if not the battle, at Orthes, and soon after the peace became a colonel and Knight of the Bath.

At Waterloo he was once more to the front with the Fifty-second, and the concluding hours of this battle were the most glorious of his life. Then occurred that movement of his regiment upon the flank of the Old Guard, a movement over which so much ink has already been spilt. The one thing actually new which is contributed in this volume (though the editor suspects it not) to the literature of this discussion is that it confirms the Duke in his oft-repeated opinion that to describe accurately the incidents of the battle of Waterloo is a task impossible for man. It appears that Colborne, who believed that his regiment had the main hand in deciding the battle, never had heard of the charge of the British Guards until he read of it at Paris in the Duke's Waterloo dispatch. It was perhaps this, bringing home to him the fact that, in a great battle, "every officer being intent upon some particular object, with a distinct part to perform, his eye is confined to a small angle," which led him once to say to a party of officers of the Fifty-second, who were finding fault with the dispatch: "For shame, gentlemen! One would think that you forgot that the Fifty-second had ever been in battle before." Like the Duke, he felt that there was glory enough for all, and the Duke's generalship he eulogized, both as displayed in the Peninsula and at Waterloo. Of the latter he wrote: "Never did any commander gain a victory more by his personal exertions and by his prompt presence at points where the efforts of the enemy had nearly succeeded."

At Waterloo, Colborne saw his last actual warfare. From 1821 to 1828 he was Lieutenant-Governor of Guernsey, and then began his service in Canada, which lasted until 1839. He left there after having served as Lieutenant-Governor of Upper Canada, as Commander-in-Chief of the forces, and finally as the first Governor-General under the new Constitution. In times of unusual stress, and of great delicacy of relations with the United States, in the rebellions of 1837 and 1838, he showed himself to be a man of all the firmness of purpose and the willingness to assume responsibility which such crises demand. His reward on his return to England was a peerage and a pension of £2,000 for three lives. But even now his services to his country were not over; for he was yet to be Lord High Commissioner of the Ionian Islands (1843-49) and Commander of the Forces in Ireland (1855-60). Thus it was not until his eighty-third year that he retired, with the rank of Field-Marshal. Two years later he died.

This was the life not of a man of genius, but of one who was, in the opinion of all his contemporaries, a type of the highest manhood. All who dealt with him, from the private soldier to the Commander-in-Chief, seem to have honored him; and if there was about him in his moments of repose a certain grave reserve which seemed like coldness, this disappeared when the time came to act, so that soldiers said of him (as was said of Sherman) that he was never so pleasant as when in battle, and the sternest sort of duties in his civil commands were always performed with a winning urbanity. In personal appearance we are told that he was the beau-ideal of a soldier, and his portraits, given in this book, bear out the saying. His character was marked by great simplicity and by an utter dislike of show and ostentation, in which respects, as well as in face, he strongly resembled the Duke of Wellington. This facial resemblance (though Colborne was much the taller man) often led to mistakes, and the Duke's own son said of it that Colborne was so ridiculously like the Duke that he could hardly help laughing, and thought that his father was talking to him.

The editor of this volume, the same who lately gave us the delightful autobiography of Sir Harry Smith, has done his work well. So far as possible, he lets Colborne's own letters and memoranda tell the story; his transitions and footnotes are always clear and to the point. The two appendices, on Sir John Moore's campaign and on the Fifty-second at Waterloo, contain useful if not wholly novel collections. The book is excellently printed, and the fine illustrations and maps are no mere makeweights, but really serve the purposes for which they are intended.

Adventures among Pictures. By C. Lewis Hind. London: Adam & Charles Black; New York: Macmillan. 1904.

This is a day in which very little is allowed to be wasted, and in which the by-products of a manufacture are often almost as profitable as the principal thing manufactured. One of the forms of modern thrift is the production of books from the odds and ends of journalism. Anything once printed seems worth preservation between covers, and the most fugitive paragraphs are scraped together and given a sort of immortality. The cost of bookmaking is thus reduced to that of illustration and mechanical execution, and the pictures are relied on to carry the text. The present volume is an example of this kind of manufacture. As editor of the *Academy*, Mr. Hind wrote, from time to time, a number of short articles having more or less relation to art, sometimes notices of exhibitions, sometimes informal reviews of new books, sometimes bits of agreeable chatter apropos of anything or nothing; and of these, carefully reprinted and embellished with twenty-four illustrations, eight of them in colors, after sundry works of art ranging from Piero di Cosimo and Botticelli to F. Caley Robinson and Fred F. Foottet, the book is composed.

The result is decidedly jerky. Mr. Hind explains that he is impressionistic on principle, and quotes Anatole France to the effect that "the good critic is he who narrates the adventures of his soul among masterpieces." He is also elaborately casual, and takes great pains to give an unpremeditated and accidental air to his utterances. He begins abruptly in the middle, after the fashion of the writer of stories, or he casts his criticism in the form of a real or imaginary dialogue. He tells us how he visited a Burlington House Exhibition of Old Masters and went home to look up what had

been said of Cuyp, and the rest of the article is made up of extracts from Ruskin on all sorts of subjects; the pictures by Cuyp never getting described. One article is called "An Admirer of Hals," and begins: "I was looking at Franz Hals's 'Laughing Cavalier' in the Wallace collection, when a voice at my elbow said: 'That's a wonderful thing—a wonderful thing, sir. The rollicking humor displayed in that face is——' " The admirer of Hals turns out to be a retired business man who has just been reading Gerald Davies's book, and who proceeds to deal it out through several pages. So we have the substance of a review without its form, and a pleasant enough article at small expense. At the end, the volume tails off into Occasional Notes, some of them not over half a page long.

All this is well enough done and must have made acceptable journalism. Mr. Hind has a knack of writing, a brisk style, and some real interest in and feeling for painting; and his avoidance of seriousness of form would prove no drawback to the immediate effectiveness of occasional writing, any more than the fact that he really has very little to say, or that he is sometimes careless and inaccurate in statement. We demand of such slight dishes only that they shall be grateful to the palate and easy of digestion; it is not necessary that they should be substantial or nourishing. There are still, however, old-fashioned people who think that a book should have some continuity and some system, and that a dinner should be something else than a collection of cold scraps. To such we cannot recommend this book.

Some of the illustrations, particularly those in black and white, after familiar masterpieces, are good; but we hope it is not strictly true that the others are "reproduced in the colors of the original paintings."

Bacteriology of Milk. By Harold Swithinbank and George Newman. E. P. Dutton & Co. 1903.

The relation of bacteria to dairy products is a subject which assumes an ever increasing importance with the knowledge that these organisms may materially aid in the manufacture of cream, butter, and cheese, or may, on the other hand, produce harmful fermentations of the milk, and spread among its consumers divers sorts of contagious disease. One is therefore inclined to receive even a bulky book on this topic with favor, especially when the authors begin by stating, "Our aim has been to systematize the bacteriological study of milk rather than incorporate every known or tested fact concerning the subject" (p. viii). Unfortunately, however, this aim has not been steady enough to withstand the temptation to encyclopædic inclusiveness which seems particularly to beset writers upon hygiene. Monographs by experts upon certain phases of the milk-supply problem are much needed; but a tome which discusses chemistry, physiology, general bacteriological technique, air and water analysis, ripening and disease fermentations of dairy products, the characteristics of pathogenic organisms, epidemiology, systematic bacteriology, legislation, practical details of dairy management and glass-blowing, can only be an heroic attempt at the impossible. The chapters on methods for anaerobic cultivation and on air analysis have, indeed, been well-handled by Mr. Swithinbank and Dr. Newman; but they are out of place in a work on the 'Bacteriology of Milk.' On the other hand, the treatment of media-making, in view of the progress made towards uniform methods by the American Public Health Association, is confusing and unsatisfactory, and the section on Water Analysis weak, since it ignores the determination of the approximate numbers of colon bacilli.

Coming to the real subject of the book, we find much to praise. In Chapters I. and V. the conditions which lead to the multiplication of bacteria in milk are discussed with much success. The authors declare themselves strongly in favor of the disputed view that normal milk from the udder of a healthy cow is sterile, thus agreeing with Lister and with Sedgwick in this country and differing from Ward, Harrison, and many others. The contamination of the product after milking is well treated, and some excellent photographs are reproduced of bacteriological culture plates exposed to the air in various localities. One, in particular, which faces page 22, well shows the way in which bacteria are carried by macroscopic solid particles, each of the larger colonies showing an obvious speck of dust at its centre. The admirable studies of Park in New York as to the relation of cleanliness, temperature, and time to the bacterial content of milk are fully quoted, and these and other figures show that while, under proper conditions, milk can be so produced that it shall contain less than 10,000 bacteria per c.c., the numbers actually found in ordinary city milk often run up into many millions. Analyzed more closely in a valuable table on page 130, it appears that during the storage of milk there is first a sudden increase in the number of bacteria, followed by a sharp decrease, then a slower but much more extensive multiplication, resulting in an enormous bacterial population, which finally again slowly declines. The authors rightly conclude that the first increase probably includes a number of microbes of various sorts originally present in considerable numbers in the milk, and that this is checked by the harmful products of the true lactic acid bacteria, which, multiplying more slowly, finally predominate overwhelmingly during the second maximum.

After this general discussion, the authors take up in Chapters VI. and VII. the industrial side of milk bacteriology, the ripening of cream, butter and cheese, and the agency of microbes therein, the use in these processes of pure cultures like the Bacillus 41 of Conn, and the various disease fermentations which may produce blue, red, yellow, bitter, soapy or ropy milk. As to the source of the lactic-acid bacteria which are of such significance in the mellowing of cream, the authors are in doubt; the recent work of Prescott on the identity of these organisms with *Bacillus coli* suggests one possibility.

The last half of the 'Bacteriology of Milk' treats the strictly sanitary side of the subject, and this section, written, according to the preface, by Dr. Newman, is the most valuable portion of the work. There is first a good review of the distribution of tubercle bacilli in milk, in which the Liverpool results are freely quoted. The question as to the transmission of bovine tuberculosis to man is well discussed, the conclusion being that at which practically all scientists have now arrived, viz., that, while rare, this transmission may and does occur. Milk epidemics, of which two hundred and fifty are now on record, come in for full treatment, their characteristics being in general a special incidence upon persons under fifteen, a short incubation period and a low mortality. Abstracts are then given of a number of outbreaks of typhoid fever, diphtheria and scarlet fever actually traced to milk, most being English and a few American. As is too common in English textbooks, German and French data are largely ignored. The most serious defect in this section is, however, the scant treatment of the relation of milk to infantile diarrhœa, which is by far the most important aspect of the entire subject. One-fifth of the children born in our large cities are swept away before the end of the first year of life, and numerous statistical studies, notably those carried out at Berlin, have shown that this slaughter is mainly due to the use of fermented cow's milk. Dr. Newman discusses the somewhat fanciful theories of Ballard and Newsholme as to the exact method in which bacteria gain access to the milk; but his treatment of practical remedial measures is quite inadequate. These measures are two: first, cleanliness in production and coolness during the transportation of the milk; second, Pasteurization before it is used. Proper conditions of production can be brought about only by systematic bacteriological examinations and the enforcement of definite standards by health officials. Messrs. Swithinbank and Newman, on page 136, in our opinion most unwisely discredit such numerical estimates; and in their conclusions, though advising that such examination should be made, add that "the time has probably not yet come for fixing a minimum [meaning maximum] standard of the number of organisms permissible." The time has come in Philadelphia and New York, where such standards have produced admirable results; the time has come in Boston, where they are to be shortly put in force; it is bound to come in all progressive communities.

The 'Bacteriology of Milk' contains a vast array of information; but, in grasp of the proportions of the subject and in judicial point of view, it cannot materially add to the progress either of the science or the art of sanitation.

The Diary of Matthew Patten of Bedford, N. H., from 1754 to 1788. Published by the Town. Concord, N. H.: The Rumford Printing Co. 1903. Pp. 545.

The settlers of the town of Bedford, in Hillsborough County, twenty miles from Concord, were Scotch-Irish Presbyterians, hardy and frugal. Matthew Patten, born in Ireland in 1719, came to this New Hampshire locality in 1738. He was a steady-going farmer, who became justice of the peace and later judge of probate. He had acquired the diary habit, it seems, early in life, but the sheets of his book previous to 1754 have been lost. He used to record his daily transactions in the simplest terms

imaginable, reciting facts, and adding no reflections. He wasted no words.

One day is much like another. The diarist writes straight through in one sweeping sentence, whether of day's work, or what not, as the following entry in September, 1755 (p. 20), will testify:

17th went to Litchfield and Got 4 gallons of rum from Thos Parker for the town and Two Quarts and a pint for James Little and 1¼ Quart for myself for which rum Richard McAlester sent 4£ my mother 5£ and my brother 2£ and the remainder I laid out myself ye whole came to 12-6-9 and recd an aCcount pr Patrick Taggart that my father in law was laid speachles at portsmouth.

So an entry in November following, where we read:

22d Got my Deed I had of Ensn MacGregores acknowledged by justice Boyes and returned home and in the evening I supposse about 9 a Clock at night there was a Smart Shock of an Earth Quake almost as hard as the hard shock on the monday night before but of not so long Continuance and Borrowed one bushell of salt from Robt Macmurphy.

This is a perfectly genuine record of the doings of a plain, hard-working man, in the days of small beginnings and modest results. It depicts stern realities in a style that knows nothing of literary merit, but which is nevertheless interesting because unstudied. The pages are full of names and incidents that must be of value to descendants of the good people of the region. An entry of June 2, 1783, "I got ½ a pint of Rum from Zech Chandler on credit and I went to the falls and I got 4 shad," reminds us that Senator Zachariah Chandler of Michigan was born in Bedford, and exhibited the traits of his ancestry.

The book has exasperating features. It lacks an index; and there is no running-title to indicate the year in which the entries are made. It seems a strange oversight that the town has not furnished at least an index of names, seeing that the diary is chiefly useful that it may be consulted by persons interested in tracing genealogy, or learning some facts with regard to an already known ancestor. Barring this serious defect, which might be repaired in a separate volume, the publication reflects credit upon the town of Bedford, for the material is worthy of preservation and the book is well printed.

A History of Two Reciprocity Treaties. By Chalfant Robinson. New Haven, Conn.: The Tuttle, Morehouse & Taylor Press.

This volume deals with the Canadian treaty of 1854 and the Hawaiian treaty of 1876; it also contains a chapter on what the author calls "The Treaty-Making Power of the House of Representatives," *i. e.*, the power of the House to refuse legislation (especially an appropriation) required for the purpose of giving effect to a treaty already duly ratified. This power has caused trouble in the past, and may do so in the future. The author's review of the matter is fair, but it is not relevant to the main purpose of his volume, and is a reprint of a magazine article.

Reciprocity seems to be a subject which attracts Mr. Robinson a good deal; he gives us here as a comment upon the full text of the Canadian and Hawaiian treaties several elaborate historical chapters and an introduction on the early trade relations of Great Britain with her colonies, and the changes produced by the independence of the United States. The value of the volume is mainly historical. The author raises questions of policy, but does not answer them, or only in a tentative way. The importance of reciprocity treaties he exaggerates, we believe, greatly; how far reciprocity tends, as he seems to think, to political union, is a very obscure problem. If it is ever tried on a great scale and for a long period of time, there will be an opportunity of finding out whether there is any general law governing the subject; hitherto the protectionists have taken very good care to prevent anything of that sort. The two most conspicuous attempts at tempering protection by reciprocity—our Canadian treaty and the Cobden treaty with Louis Napoleon—were not suffered to poison the protectionist air of either France or the United States for many years, and the third experiment, the McKinley-Kasson reciprocity treaties, are still *in gremio Senatus*, and not likely to get much further. To free traders reciprocity combined with protection is an absurdity, or at best a mere expedient. Cobden himself only believed in it so far as to think that a good treaty with France *might* enlighten that country through the operation of its own beneficence; but it did not. The fact is, that reciprocity and protection, instead of being, as some protectionists have always fondly imagined, supplementary in nature to one another, are in essence mutually repugnant, especially in a system like our own, where every tariff is the result of a sort of bargain made among all the leading industrial interests. The theory is that you clap on a high duty on something, and then lower it as an inducement to the foreign nation to make a corresponding reduction; but, in practice, the duty in question turns out to be essential to the system, and the parties to the bargain cannot be brought to take it off. Such, at least, has been our recent experience. But it will probably be centuries before the reciprocity illusion is entirely dissipated.

Le Origini degli Stati Uniti d'America. Da Gennaro Mondaini. (Collezione Villari.) Milan: U. Hoepli; New York: G. E. Stechert. 1904.

It is a significant fact that although Cavour took the English parliamentary system for the model of the Piedmontese, which later became the Italian, the political development of Italy has been rather along Latin than Anglo-Saxon lines. France, with her centralization and bureaucracy, has set the example which Italy has followed; racial affinity has proved stronger than the ideals of a few thinkers and statesmen. Had Cavour lived twenty years, he might have held his country closer to the constitutional practices of Westminster, which he admired. But since 1861 the drift in Italy has been away from England, and, needless to say, Italians have paid but little attention to American history and government, or they would not have rested content with the popular history of the American Revolution which Carlo Botta wrote a century ago and they still refer to as an authority.

We give a particular welcome, therefore, to Signor Mondaini's 'Le Origini degli Stati Uniti,' the latest volume in the excellent series of histories edited by Prof. Pasquale Villari. This is a book thoroughly up-to-date, written by a man trained in the modern methods of historical investigation, who has, moreover, a firm grasp of his subject and a straightforward style. He describes in seven chapters the beginnings of European settlements in North America, the Puritans, the plantations in the South, the commercial society of New York and Pennsylvania, the struggle between the English and the French colonists for possession of the continent, and the war of independence. In a final chapter he describes the political organization of the new society, and its tendencies at the birth of the republic.

His work blends the general purpose of Mr. Bryce and that of Mr. Goldwin Smith. It might well serve as a manual for the American student, because, in addition to giving a brief narrative of events and a critical comment on social and political conditions, it expresses the opinions of an intelligent foreigner who approaches the subject without prejudice. He treats the Puritan and the Virginian with equal fairness, and, what is perhaps a harder task, he indicates briefly but very clearly the steps by which the character of each was slowly transformed. Particularly striking is his picture of the Constitution, which apparently created a government so decentralized that, in theory at least, it ought to have been in a perpetual state of deadlock, for any one of the three branches—the President, the Senate, or the House—could block the activity of the other two, while the Supreme Court could declare unconstitutional laws which the Congress had passed and the Executive had approved. Signor Mondaini has mastered his subject so well that we hope that he may, in a second volume of similar character, describe the development of the American Union during the nineteenth century.

A story of the great exploration in 1804-6; with a description of the old trail, based upon actual travel over it, and of the changes found a century later.

By OLIN D. WHEELER. *2 volumes, 8vo, 200 illustrations. Net $6.00 (Carriage 40c.)*

This work is not a re-hash of the famous Journal of Lewis and Clark. While the great epic story of this exploration is given, the work contains also a description of the Trail at the present time, and thus are presented, both by pen and by picture, the strong contrasts between the country as seen by the intrepid explorers and the scenes which meet the eye of the traveler of to-day, journeying in safety and comfort.

A Norwegian Rambler

Among the Fjelds, Fjords, Mountains and Glaciers

By ONE OF THE RAMBLERS

16mo, illustrated, net $1.20

As breezy as the mountains it describes.

The Veil of the Temple

By W. H. MALLOCK

12mo, net $1.20.

A story of English society, by the author of "A Romance of the Nineteenth Century."

Russia:

Her Strength and Her Weakness

By WOLF VON SCHIERBRAND, Ph.D.

12mo, with maps.

A brilliant analysis of Russia of today from several points of view which have not so far received the attention to which they seem entitled.

Field Book of Wild Birds and Their Music

By F. SCHUYLER MATHEWS

Author of "Field Book of American Wild Flowers," etc.

16mo, with 38 colored and 15 other full-page illustrations, and numerous musical diagrams. Cloth, net $2.00, Full limp leather, net $2.50.

A description of the songs and coloring of wild birds which will enable any one to easily identify them.

Bog-Trotting for Orchids

By GRACE GREYLOCK NILES

8vo, with 24 colored and 48 other full-page illustrations. Net $2.50. (By mail $2.70.)

A delightful record of journeys to the haunts of these wonderful flowers. The reader will be surprised at their number and rare beauty.

The Mystic Mid-Region

The Deserts of the South-West

By ARTHUR J. BURDICK

8vo, 54 illustrations, net $2.00.

A delightful chronicle of the desert's pleasures and terrors, dangers and delights, mysteries and revelations.

The Heart of the Orient

Saunterings through Georgia, Armenia, Persia, Turkomania, and Turkestan to the Vale of Paradise.

By M. M. SHOEMAKER

8vo, with 52 illustrations.

The Heart of the Orient, from high life at Persian Court to low life in the tents of Kerghiz.

The Jessica Letters

An Editor's Romance

12mo, net, $1.10

Full of wit and refreshing frankness.

The Nation.

NEW YORK, THURSDAY, MAY 26, 1904.

The Week.

Amid the confident Republican prophecies of discord and folly at the St. Louis Convention, it may not be generally realized that one thing is already assured—the Democratic platform will this year be sound on the money question. Be the candidate who he may, he will not be for free silver. Nor will he be for any kind of meddling with the gold standard. So much is made certain by the action already had in State Conventions, and by the overwhelming drift in the party. Of the delegates now elected, at least two-thirds are against dragging the free-silver corpse from its grave; and, with the South returning rapidly to its historic position in favor of sound money, there can be no doubt that the St. Louis platform will be satisfactory on the currency issue, whatever its other planks may be. The efforts of Mr. Bryan to secure a reaffirmation of the Kansas City platform have come absolutely to nothing. Two or three Hearst-ridden States have gone in for that madness—having accepted him, why should they stick at anything?—but the great phalanx of Eastern and Southern States which have to elect the President, if any Democrat can be elected at all, have shown beyond a peradventure that they will have none of it. They may divide about candidates, but they are unanimous against breaking a leg twice over the same free-silver stone.

A significant announcement from Nebraska implies that Mr. Bryan himself is aware of the futility of further struggles against the inevitable. He is going to stump his own State as a candidate for the United States Senate. Nebraska Republicans have been so shamed and demoralized by the methods of Dietrich and his kind that the State is now regarded as fair fighting-ground. As so many times before, the Republicans have "redeemed" Nebraska from the Populists only to make its last state worse than the first. Bryan may succeed in carrying the Legislature. Obviously, however, as a candidate for the Senate on the regular ticket, he cannot be the enraged and irreconcilable bolter that complacent Republicans have pictured him.

For invincible optimism, commend us to the official Administration view of the party rent in Wisconsin. It is admitted, to be sure, that the Democrats will very likely win the Governorship, and that the Republicans will lose two or three Congressmen, but what of that? All factions are going to work hard for the electoral ticket, and that is enough for Washington. Defeated Congressmen can be "taken care of"; even if control of the House should be lost in consequence of the quarrel, it would not really signify. The Administration would still live. We have our doubts, however, whether this cheerfulness is not a little forced. It will certainly be thought so in Wisconsin. On the other hand, if, from the news which comes out of Illinois, Wisconsin, Indiana, and Massachusetts, the uninstructed reader should gain the impression that there is anything but harmony in the Republican party, it can instantly be disposed of by turning the pointer to Ohio and Iowa. Never did lion and lamb lie down together with more convincing manifestations of real brotherly love than do Senators Dick and Foraker. As for Secretary Shaw's State, it was evidently a mistake ever to suppose that the Iowa idea meant a friendly revision of the tariff. More than two-thirds of the national delegates protest that orthodox Republicans, at least, entertain no such idea. Last year's platform was so delicately balanced that the voter might fancy it inclining either way. This year's will be immovable in any direction. "Gov. Cummins of Iowa is the only man who can save you from the wrath to come," declared Congressman John Sharp Williams in one of his tariff speeches last winter. But the Republican leaders will have none of such means of salvation. One wrath at a time for them, and that of the protected manufacturer is more vivid than any tearful dread of future judgment.

Senator Daniel of Virginia says the American people are not going to stand the Republican policy of "dumping" much longer. Secretary Shaw, however, is of quite another mind. He told the Iowa State Convention last week that the chief issue of the campaign this year would be the Democratic claim that American goods are sold cheaper abroad than at home. But, he adds, while this is true in a way, the fact can be proved only as to about one-thirtieth of our exports. The astonishing thing is that it can be proved even to that extent, as the people who sell abroad at less than cost are not, as a rule, disposed to publish the fact. We trust Secretary Shaw has not based his present estimate entirely on the export price of commodities as figured by the Treasury Department. But, taking his figures at their face, they show that about $50,000,000 of American goods are annually sold abroad at less than the domestic prices—a fact which the Democrats may be able to use to advantage. According to the Iowa Republicans, protection must be maintained to its full extent in order to keep American industries from making war on each other. That is, certain manufacturers must be allowed to charge domestic consumers such inflated prices that they can afford to sell at a loss abroad. If they are not, there will be some throat-cutting among the friends of protection. No one has a right to say that a man shall not sell his goods abroad at any price he may care to name. But when the Government taxes 80,000,000 people to make good his losses, that is another thing.

President Roosevelt's letter, read at the Cuban banquet on Friday night, goes frankly upon the supposition that he is the big policeman of this hemisphere. All his professions of friendliness are qualified by the assertion, "Brutal wrongdoing, or an impotence which results in a general loosening of the ties of civilized society, may finally require intervention." Note, the wrongdoing is not directed against this country. It is not a case of impaired national rights that the President has in mind. His position is, rather, that if we do not like the kind of government maintained in neighboring republics, we will step in to compel a change or to take over the territory. Such a proceeding is as unknown to international law as were the doctrines which the President invented and applied to Panama. The right of intervention has been discussed and defined in hundreds of text-books, but not one of them recognizes this dangerous assumption of President Roosevelt's. How filled his mind is with it appears from the unconscious way in which he gives it expression. He probably does not intend to translate it into action until after election; but the inference is disquieting that, as soon as chosen President, he will set about a vigorous "policing" of San Domingo and the rest.

With so many able editors enthusiastic for Roosevelt, he yet seems strangely to lack outspoken defenders in the press. The eloquent silence of Republican newspapers about his pension order, for example, filled the American correspondent of the London *Times* with astonishment. Mr. Smalley could not understand that sort of thing. To have nothing to say when the leader of your party is attacked, is a new conception of journalistic loyalty. Another instance of the same thing is the entire failure of the leading Republican organs to speak a good word for the President in the Van Cott case. In the face of the reproaches of the Democratic and

independent press, they are absolutely dumb. We admit that they had a hard case on their hands. The facts showed conclusively that the Postmaster of New York was grossly unfit to be kept in office; but why, nimbly evading the facts, could there not have been an indignant hurling back of "slanders," in the good old thick-and-thin style? The *Tribune* printed all the news, but could not find its editorial voice. It has, however, a good precedent for keeping its zeal for Roosevelt so carefully under restraint. Horace Greeley wrote that he "supported" Taylor in 1848, but added: "I did not hurry myself to secure his election."

Interesting side lights on the pension industry are furnished by the testimony taken in the Federal Court at Portland, Ore., in the case of Pension Agent T. A. Wood and his son, Hosea Wood, charged with conspiracy to defraud the Government. Nearly all the applicants appearing before Agent Wood were Indian fighters, and a careless crew they were. R. B. Wilmott, who appears to have led a company, testified "that he had not intended to sign the affidavit used by Mrs. Rosetta Garrison, but that her name had been written into a blank affidavit which he signed, expecting it to be used for some member of his company." It was his custom to sign blank affidavits, he added, and trust to the agent, Wood, to use them for the benefit of his old comrades in arms. Joseph Gibson was another trustful soul who was deceived. Counting upon the upright Wood, Gibson had signed seventy-five blank affidavits. In the case of Cornelius Beals it appears that "he had his doubts," as also when he vouched for Sarah A. Hill, an Indian war widow. "He called the attention of Wood to the fact that she had been married after the death of her husband, the Indian fighter." But Wood said "it was all right for him to make the affidavit, notwithstanding the subsequent marriage."

Another witness who helped to illustrate Wood's methods was Joseph Melrath, the notary public who was employed by the pension agent to affix his jurat to the affidavits as they were used. "There were shown him a bundle of claims, affidavits, and fee agreements which bore his jurat, and which other witnesses said they did not swear to on the date shown by his jurat." Mr. Melrath admitted that they were right, since on the date when the greater number of the affidavits were supposed to have been acknowledged, he had not even been in Portland. His excuse was: "Hosea asked me to let him do the dating, because he did not like my style of dating." It was Hiram Wood, "a gray-haired veteran," unable to sign his name, who seemed best to exemplify the friendly spirit of the Wood method. He had made his mark on a number of blank affidavits without intending them to be used to further the claims of Harvey A. Hogue, Jane Greer, and others, but hastened to add that "he knew the parties named and could have sworn to their claims." It was he also who "amused the spectators by hanging his feet over the jury-box and remarking to Judge Bellinger in the midst of the proceedings: 'You've got pretty old since I seen you last.'"

Several interesting commercial problems hinge on the arguments which began on May 18 before the Interstate Commerce Commission. Primarily, the question at issue is that of railway "differentials," by which is meant a concession, or handicap, allowed to a given railway, or to railways running to a given port. The theory of the "differential" was that if, for instance, all railways running from Buffalo to the seaboard had agreed on uniform rates for carrying export freight, a railway less favorably equipped than the others, or running to a port less advantageously situated, might properly be permitted to charge a lower rate. Such a concession was to do no more than counterbalance the disadvantages under which the "differential" railway labored. The present dispute chiefly concerns "differentials" in favor of railways serving Philadelphia, Baltimore, and outlets for the South. The claim of the New York lines is that these ports have outgrown the conditions which were originally met by the differential concessions. For evidence, statistics are submitted showing that, in the past twenty or thirty years, New York has lost much ground in the export trade, relatively to outside ports. Its shipments of wheat and corn in 1881, for instance, were 60 per cent. of the country's entire export, whereas in 1903 the ratio was only 44 per cent.

There is undoubtedly good ground for arguing that, under present conditions, the "differentials" allowed to many of these outlying ports have discriminated unjustly against New York. But it would be a great mistake to suppose that this is the whole cause of the decline in New York's percentage of our total export trade. In facilities for storage, for harbor transportation, and for dock room, all seaports are limited, and when the limit is approached, an overflow of the country's growing traffic to the younger ports is inevitable and altogether desirable. Construction of the great grain elevators in the Chesapeake, improvement of the freight service southward from the Middle West to New Orleans, and the building of new railways from the Nebraska corn belt to the Gulf, drew to those export points a good deal of export business which, under old conditions, would theoretically have come to New York city. It was perfectly natural that, with the rapid growth of such facilities, these other ports should have increased by leaps and bounds the percentage of the country's export trade handled by them. It was equally natural that the ratio of this city's exports to the total should in some degree decline. But it should be equally plain that, with this advance in facilities of the younger ports, the argument for "differentials" disappears.

President Parry discussed the labor problem in his annual address on May 17 before the National Association of Manufacturers at Pittsburgh. This organization stands for sound ideas regarding the open shop and freedom from union tyrannies. President Parry says that all employers would prefer to see their men highly paid than to see them struggling for a mere livelihood, but he asserts that the blame for low wages cannot be thrown on the former. The only way to raise wages is to increase per-capita production. There cannot be any doubt on this point. Labor is essentially paid in kind. What people work for are the things they eat, drink, and wear. Anything that restricts the amount of such things decreases the amount consumed by those who produce them—that is, lowers their real wages. If the labor unions could once master this idea, they would see the folly of their course in trying to limit production. The cost of commodities must always be based on the unit of production. What the working man needs is the chance to work to his full capacity in turning out the units; but this is just what the labor unions aim to defeat.

The freight-handlers' strike on the Sound boats is a naked attempt to force recognition of the union. In his formal statement, Jacob W. Miller, general manager of the marine district of the New York, New Haven and Hartford Railroad Company, says that the only question at issue is whether he shall discharge an assistant foreman who has "served for many years faithfully," but who has not joined the union. Mr. Miller adds: "The public can decide whether or not a corporation should do such an unusually inhumane act, even though its own very large interests may be jeopardized by thus protecting the welfare of one true man." The demand that a foreman shall be thrown out of work because he does not choose to bow to the union and submit to the whims of a walking delegate, would be regarded as too preposterous for serious consideration were it not that unions are everywhere securing such admission of their absurd claims. As for the jeopardy to large interests of which Mr. Miller

speaks, no doubt the company may suffer a temporary loss by maintaining its position; but we can imagine no course more unwise and disastrous in the long run than the sacrifice of a faithful employee to an irresponsible union.

North Carolina, Alabama, and Kansas have clashed in the Government Printing-Office. John Martin of Morgantown, N. C., is a "highly esteemed young man," and when he was assigned to a "case" beside a young Alabama negro he objected. The white compositor's protest was made to Division Foreman Roberts, "who hails from Kansas," and who informed Martin, when a second request for a transfer was received, that "the negro was as good as he." Mr. Ricketts, foreman of printing, upon being appealed to, replied that the President's attitude in this matter of recognizing the rights of negroes is so well known that he had no other course than to sustain Roberts. North Carolina interprets the situation as an insult to an esteemed citizen; Alabama is humiliated because the authorities are standing behind her "nigger" and giving all the other colored men in the printing-office an unnaturally haughty air; and Kansas, with characteristic modesty, is conscious of having struck a blow for industrial equality. The incident suggests the practical dread of business competition which lies behind much of the talk about "race purity."

So long as Mr. Balfour is alert enough to emasculate both free trade and protectionist resolutions in the Commons, he cannot be beaten on the fiscal issue; but it is hard to see how he can continue mere Parliamentary evasions and avoid the accusation of cowardice. That charge Lord Hugh Cecil made roundly against Mr. Chamberlain last week. Mr. Balfour himself is in the position of affirming nothing and denying nothing. He cannot even reaffirm his own doctrine of retaliation, for, with his Chamberlainite following, he must go the whole way or not at all. Yet the Premier's rather humiliating weakness on the main issue should not disguise the fact that he is pretty strong in the division lobbies. His appeal is to convinced partisans of Sir Michael Hicks-Beach's type, and even more to the numerous members of both sides who see in a general election the end of their Parliamentary lives—for the next appeal to the constituencies will probably make a revolutionary change in the personnel of the Commons. Everybody realizes that, and many who theoretically would like to upset the Ministry, practically stay their hands when they think of saying good-by to their seats. In rather striking contrast to Mr. Balfour's agility in keeping himself politically alive long after his political *raison d'être* has ceased, is Mr. Chamberlain's forthright capture of the Liberal-Unionist organization. To be sure, that is only a shell, but possession of it makes it easier to discipline the Free Trade Unionists, who will be driven into open secession with Mr. Winston Churchill's group, or back to the party fold with Sir Michael Hicks-Beach.

It is at last admitted in Parliament that war exists between England and Tibet. On all hands it will be a relief to be rid of the pretence of a diplomatic mission. The Government will now be able to call any one who questions the wisdom of the war a traitor, or, worse, a Little Englander. Lord Lansdowne has already termed the Tibetans "rabid barbarians," and the Ministerial press, which has been praising Col. Younghusband for emphasizing the amiability of the Lama's subjects, will doubtless follow Lord Lansdowne's lead. The whole affair shows once more that parliamentary safeguards are relatively useless when an executive officer is willing to take the chances of war. In the present case, Lord Curzon's expedition was organized on the principle of heads I win, tails you lose; for either a diplomatic or military triumph would presumably make him Duke of Lhasa. The reckoning, however, is likely to be painful to the Indian taxpayer, who will bear the brunt of the expense, and possibly to the rate-payer at home. Gen. Macdonald's brigade is already in a very insecure position, and reinforcements will probably have to be got up to the roof of the world. As significant, finally, as Lord Lansdowne's abuse of the enemy was the refusal of the War Office to forecast the probable settlement. This is in striking contrast to Mr. Balfour's general disclaimer of territorial ambitions in Tibet. Now that a state of war is admitted, the time for disclaimers is over.

Evidently the channel of Port Arthur is obstructed, not blocked, and all Japanese landing operations in the Liaotung Gulf are threatened by the existence of a formidable fleet in being. Since the loss of the *Hatsuse*, Togo's superiority is not sufficient to allow him to disregard the Port Arthur squadron, and it seems very likely that a descent in force upon Niu-Chwang must wait until Port Arthur is reduced and the Russian fleet destroyed. That should be a very costly matter, for it is probable that the attack will be pressed in order that Kuroki, who now seems waiting for the peninsula campaign to be carried out, may strike at Mukden before Kuropatkin has been greatly reinforced. In short, except for the presence of armies on the ground, the case stands as it did after the first attack upon Port Arthur; the Japanese must confine their operations to the Korean Gulf until it is certain that the Russian fleet cannot interfere with the transport service. Wild speculations as to the probability of the Baltic squadron changing the naval balance of power this summer bear their improbable character on their face.

The sinking of the *Hatsuse*, presumably by a Russian mine, while ten or twelve miles off Port Arthur, has excited wide discussion and, in some bosoms, a good deal of indignation. Outcries against the Russians are premature so long as we do not know whether they have done what they are charged with—namely, sowing mines broadcast in the open sea. The *Hatsuse* may have been destroyed by a mine accidentally adrift—perhaps by a Japanese mine. It remains true, however, that a grave principle of military and international law is involved in the dispute. That the laws of naval warfare should have been so little codified hitherto is somewhat surprising. The rules of war on land are much more elaborately and precisely fixed. The Hague Conference extended the principles of the Geneva Convention to maritime warfare, but that, of course, relates mainly to hospital ships, etc., and does not touch the questions now raised. A few national regulations have been published, as, for example, our own Naval War Code recently issued; but even here we get general principles rather than specific details. Our code, for example, permits "measures that are indispensable for securing the ends of the war, and that are in accordance with modern laws and usages of war." Evidently, that gets us "no forrarder." The very thing we want to know is, what are the laws and usages of war, as bearing on the employment of floating mines?

Americans and Englishmen are making the most numerous exclamations against these war implements. They do it, we must say, with uncommon ill grace; since it was they who, at the Hague Conference, consistently opposed the various proposals to diminish the destructiveness and cruelty of the weapons and methods of war. Against the prohibition of the "dum-dum" bullet and of shells containing asphyxiating gases, the American and English delegates voted. They were also more than cold to the propositions in the fourth paragraph of Count Muravieff's circular, one of which was: "The prohibition of the use, in naval battles, of submarine and diving torpedo boats, or all other agencies of destruction of the same nature." That, argued the Americans and English jointly, would be to put a check upon inventiveness; and Capt. Mahan recalled the fact that the first use of the torpedo was denounced as cruel and unlawful. He was for giving inventors free play.

THE SELF-ELECTOR.

President Roosevelt's attitude towards his own election is paradoxical. On the one hand we seem to have a President of the nicest scruple and utmost delicacy. He will make no speeches to induce his fellow-countrymen to keep him in the Presidency. His record is before them: if they approve, and desire to reward, well and good; if not, he is prepared to accept their verdict with a quiet and even mind. In any case, he will maintain the dignity of his high office. He will not even resort to the time-honored device of receiving "delegations," over whose heads he may address the people with artful appeals for votes. All this regard for the proprieties is admirably—if a trifle ostentatiously—correct. We see joined to it, however, the spectacle of a President working for his reëlection with a directness, an unconcealed and unintermitted activity, and a choice of methods unexampled. Nothing is too small for Mr. Roosevelt's oversight. The platform has first to get his *imprimatur*. Even the speech in which he is to be nominated at Chicago must be submitted to his expert literary revision. For all we know, he may have designated the men who are to lead the cheering. No detail seems to escape him; for, as a somewhat disgusted Republican Senator said, when referring to the party's political arrangements, "The President bothers about everything." As for the selection of a National Chairman, Mr. Roosevelt has made that a personal perquisite in a way to attract unfavorable comment from even the most loyal of Republicans, as the *Tribune's* Washington correspondent frankly admits.

To break up a Cabinet in order to get a head for a political committee, strikes people as a violent process. Secretary Cortelyou has barely begun his work in a department which the President himself has described as of the highest importance. Execution of some of the policies supposed to be nearest his heart is confided to the Secretary of Commerce. Yet the latter is to throw up his office and give way to an untried successor, all for an imagined exigency in party politics. To the objections of Republicans who have borne the heat and burden of the day—namely, that Mr. Cortelyou is too recent a convert from Democracy (he voted for Cleveland in 1892) to be placed in charge of the Republican campaign—we attach little weight. The significant thing is, that the President is ready to disarrange Government affairs in order to secure a chairman who shall be, in a peculiar sense, his personal representative. What is left, then, of the President's assumed delicacy? He will not speak, but he will work and plan night and day; he will dictate everything; he will be his own manager, for, of course, Cortelyou really means Roosevelt; he will not fling himself at the heads of the people, but he will control and minutely supervise every man who goes to them in his name.

This is not all. The man whom the President has personally selected to extol and nominate him at Chicago went direct from the White House to tell the reporters of his profound disgust with those who were making it a "fad" to "war against vice." At the very moment when the Bishop of New York was congratulating the community on the triumph of a great moral protest, and when the press, both secular and religious, was recording and rejoicing over the victory, ex-Gov. Black was declaring that "the whole thing reeks of hypocrisy." This was no insinuated scoff of a coward tongue; it was the unblushing, the open, the cynical, and deliberate utterance of President Roosevelt's chosen spokesman.

Washington dispatches inform us that Mr. Roosevelt, with a fine detachment all his own, has already read over the ex-Governor's laudatory speech, and is convinced that it will produce a deep impression upon both convention and country. It may. If the Democratic press seizes the opportunity now before it, Mr. Black's contempt for reform and public morality will be so well understood that his praise of the reforming and moral Roosevelt will seem like elaborate sarcasm. It is no new thing for the ex-Governor. His present scorn for those who would suppress felonious gambling recalls the disdain which he expressed in his first message to the Legislature for all who strove to improve the public service. At them, too, he sneered as men who had found in civil-service reform a "capital" without which they would be "bankrupt." Their plan, he affirmed, was not "necessarily high-toned because it lacks common sense"; and he went on with the frank brutality of a jobber in offices to say that "in my judgment civil service [*sic*] will work better with less starch."

Mr. Roosevelt strove mightily, when Governor, to put back the starch which Gov. Black took out. That showed sufficiently what he thought of his predecessor's methods. What he thought of his political manners and morals has been in no doubt. The cynical spoilsman can have but the smallest personal attraction for the hearty reformer. Why, then, was the cynic selected to sound the praises of the reformer? Only, we suppose, on that theory of being "devilish sly" in politics which occasionally afflicts and subdues President Roosevelt. His idea appears to have been that it was necessary to reassure other States about his prospects in New York. Disquieting rumors have been afloat. It has been alleged that the Republican machine was not enthusiastic. So the President has reached for a man in the very interior of the machine. The ex-Governor is an epigrammatic orator, and if he follows his native impulses his phrase-making will be at the expense of the reformer and an insult to the moralist. He is quite capable of glorifying his own spoilsman's principles, and asking the Convention if it cares anything about "a jobless faith, or a creed which dooms a man to a lean and plunderless integrity."

THE WESTERN REPUBLICAN CONVENTIONS.

Republican conventions in Western States have no pity, this year, for the repose of Presidential candidates. The outright split in Wisconsin last week is a cloud on Republican prospects considerably bigger than a man's hand. If persisted in, the bolt led by Senator Spooner will infallibly enable the Democrats to elect a Governor, while, in the war to the knife between the two Republican factions, Congressional districts are in danger of being lost and the electoral ticket itself is in peril.

Of the merits of the Wisconsin quarrel it is impossible for the distant observer to gain a clear view. Each side denounces the other in unmeasured terms. Each accuses the other of cheating. A man so devoted to party "regularity" as Senator Spooner, and so fertile in metaphysical reasons for surrendering his private judgment to party policy, must have felt himself bitterly wronged before being willing to lead a revolt. Yet it does not appear that his faction would have had a majority of the convention even if the contesting delegates had been seated. Doubtless the intention is to get the National Convention, or the National Committee, to adjust the differences; and every effort will surely be made to induce the two factions to relax their grip on each other's throat. But party strifes of this kind are notoriously hard to quell, even if a formal truce be declared; and Republicans who remember what havoc was wrought by "half-breeds" and "stalwarts" in this State, cannot but be disturbed as they see those very names, and the ferocity that went with them, making themselves at home in Wisconsin.

It is true that Senator Spooner gives his assurance that there is no danger to party prospects in the nomination of two State tickets. Certainly the plurality of 105,000 for McKinley electors in 1900 yields a good margin of safety. Still, there are manifest difficulties, and not the least of them is found in the Wisconsin ballot law. The two conventions at Madison named the same set of Presidential electors, indeed, but the statutes forbid the printing of any candidate's name twice on the official ballot, even though he is nominated for the same office by several organizations. Since the two tickets were put forth simultaneously, each elector will appar-

ently have the right to decide in which party column his name shall appear. Unless some truce is patched up, therefore, or one faction submits to being thrown out of court by the National Convention, it will require a large amount of "splitting" for either "stalwart" or "half-breed" to vote a full electoral ticket. Mechanically speaking, it will be very much easier to vote the full Democratic ticket. In view of the dangers, it is hard to believe that such astute politicians as are engineering the Wisconsin fight will maintain their unyielding attitude after the National Convention has pronounced on the question of regularity.

In Illinois, the celestial angers of the State Convention have been varied by Olympian laughter. So prolonged and stubborn a contest for the nomination of Governor is without precedent, certainly for many years. On its face, the struggle might be thought to be an old-fashioned one between rival aspirants, without the intervention of a machine to make everything go off with smooth celerity; but closer inspection shows that it is simply three or four machines in a deadlock. The solidity and stolidity of the array of delegates for each of the leading candidates bespeak pledged and fettered men rather than representatives of the party met to consult its highest interests. Gov. Yates has been one of the most conspicuous son-of-his-father failures; while an argument openly used in behalf of Lowden is that, being very rich, he can afford to be an honest Governor.

What one is most struck by, however, in all this hurly-burly of quarrelsome conventions, is the indication that the whole system is breaking down. There is nothing sacred about it. It was merely a party shift, to begin with, supplanting the Congressional caucus only because it was expected to work better. But it now working pretty badly. Conventions are confessedly unwieldy—members in some States run to 1,500, or more—and expensive; and if they lead to many more such wearisome deadlocks or huge wrangles as we are now seeing, the question of an alternative method may well be raised. Of course, the idea was to base the convention as broadly as possible so as to give the people large participation, and hence make them more satisfied with the result. In practice, however, it appears that 1,500 nobodies are less fitted to deliberate and decide wisely than 100 capable men, while much more exposed to being deceived or corrupted or led away madly in a "stampede." With the thousand or more delegates on the floor, we have come to have the 5,000 or so in the galleries, doing all they can to make the convention take on the appearance of a mob, and so still further to degrade it. After the Chicago Convention of 1892 there was much discussion of the evils of crowd-ridden conventions, and proposals were made to limit them to actual delegates and reporters for the press. The proceedings at Springfield, Ill., certainly point to the need of some such remedy, joined with a limitation of the number of delegates, if the whole convention system is not to fall into disrepute.

And how strange a light do the Wisconsin and Illinois rows throw upon the conception of government by party! "Party," wrote Burke, "is a body of men united, for promoting by their joint endeavors the national interest, upon some particular principle in which they are all agreed." But what principle, particular or general, unites or divides these warring Republican factions? They profess the same party doctrines, yet they fly at each other like wolves. No principle whatever is at stake. Spoils, power, office, plunder—these are the controlling things. And what we ask is how even a National Convention, dominated by men who dream only of patronage and faction and personal advantage, can be expected to formulate a real body of party principles? Drawn by their hand, the platform is sure to be, in Burke's language again, "unsafe to touch and unsafe to stand on"—"a tessellated pavement without cement."

NEGRO CHURCHES.

"The negro church," declared the report of the Atlanta Conference of 1898, "is the only social institution of the negroes which started in the African forest and survived slavery; under the leadership of priest or medicine man, afterwards of the Christian pastor, the church preserved in itself the remnants of African tribal life, and became after emancipation the centre of negro social life." The extended study of American negro churches, made under the direction of Atlanta University and just published, approaches the subject from this point of view.

Of all the forces active in the negro's uplifting, his church is the one which is most self-directed, and does its work along the lines of the inherited tendencies of the race instead of against them. Regarded as the direct descendant of the wild gatherings in the African jungles for the Obeah sorcery, both the strength and the weakness of the negro church can be better understood. While the political rights of the race have been denied, its churches have been allowed to flourish, with but few exceptions, since the time when the theologians discovered that it was proper to hold Christians in slavery. One of the most impressive facts brought out in the present monograph is the strong desire of the negro to have churches of his own, with the great number of instances in which these have been successfully established and maintained. "Nothing is more striking or hopeful for the negroes than the manifest fact that mere charity of patronage, however bountiful, has not satisfied them." The richest denomination "has nearly the smallest negro membership, not because it does not give to them, but because it does not treat them as equals." On the other hand, the denomination with the largest negro membership "is confronted by the strange fact that its black members have actually refused alms, while the Methodist Episcopal Church has a hard time to keep its colored membership from secession, despite pecuniary advantages." While in many cases established by missionary efforts of the whites, the 27,000 negro churches, with their three and a half million members and thirty millions of property, are monuments to the negro's own zeal. The congregation becomes his social unit. His naturally demonstrative and emotional nature gives character to his worship.

The vital present problem is the supplanting of the old-time emotional exhorter, famous only for the "rousement" of his discourses, divorcing his religion entirely from practically morality, and often setting the worst of examples in his personal life, by the educated minister who becomes a force for good among his people. The change in the old order encounters tremendous difficulties. The negroes are prone to schism, and are only too ready to leave a church or get rid of its pastor if the preaching fails to suit their taste. Young men who are capable of better things in the pulpit, are often forced by circumstances too strong for them into following those traditions of the negro church which take it farthest back toward barbarism.

Those who compiled the Atlanta report chose as fields for more detailed study a Black-Belt county, and cities and towns of various sections, both North and South. Opinions which were collected from intelligent negroes as well as white men show decided differences in regard to the way in which the church is fulfilling its trust. In Thomas County, Ga., where the churches have split until there is one to every 150 negroes, the investigator reports that the young people look upon these largely as "bureaus to provide amusement" (not all white churches are free from like reproach), and that "some of the secret societies are more vigilant as to their constituencies than the church." Scandals concerning the preachers are frequent. "The majority of ministers," says the report, "are unlearned or ignorant men, ignorant in the sense of fitness for leadership." In the larger cities, on the other hand, where common interest in property keeps congregations together, the standard appears to be far higher. Many instances are reported in which colored ministers have the thorough esteem and

confidence of the white men in their communities. Outside of certain localities, the evidence can hardly be disputed that there has been improvement of late years both in the character of ministers and in the general moral level of the people. "Forty years ago," says the report of the Baptist Home Mission Society, "the minister who could read was the exception; now the exception is one who cannot." Under conditions of freedom, it is the almost unanimous opinion of those, both white and black, whose views have been sought, that the crying need of the negro church is for a devoted, intelligent, and high-principled ministry.

"The best negroes," said a Southern delegate before the General Assembly of the Presbyterian Church recently, "are the Roman Catholics and the Presbyterians." The element of truth behind such a statement as this is probably that the class which leaves the "shouting" Baptist or Methodist Church for a colder intellectualism on the one hand, or a solemn ritual on the other, is likely to be above the average in intelligence and character. One of the contributors to the Atlanta report makes an interesting analysis of the history of the negro ministry. The minister of slavery and early freedom was ignorant, but a real leader of his people in temporal as well as spiritual affairs. Such instances are to be found as that of "Uncle Jack" in Virginia, whose freedom was bought for him by his white neighbors, and whose influence over his people was so great that planters, instead of punishing their slaves, often referred them to the discipline of their pastor, which was more effective. After the war, the negro congregations were without homes, and the minister who could raise money for church building came into favor regardless of his piety or morality. Church debts since that time have made it necessary to have ministers who could keep the churches full, and have distracted interest from the spiritual aspects of religion. When the children in the colored public schools of Atlanta were asked for their definition of Christianity, less than half gave preference to a moral conception over a more or less hazy theology. The minister most needed by the negro is one who shall bring his religion into as close connection as possible with every-day life.

A CORPORATION AND ITS SOUL.

Though corporations usually have no souls, the Western Union at any rate is undergoing the painful process of acquiring one. During the last few weeks the officers and directors of the company have received enough spiritual admonition to create a soul under the ribs of death. President Clowry's order of Tuesday week, cutting off telegraphic service from the poolrooms, indicates a growing knowledge not only of practical affairs, but also of moral law. If the public did not take Col. Clowry's announcement at its face value, he has only himself to blame for the prevalent skepticism, since his case is not unlike that of the maid who, whispering she would ne'er consent—consented.

When the committee of the City Club charged officers of the Western Union with knowingly abetting a felony, and with coöperating to make the running of poolrooms secret and successful, President Clowry remained silent for a few days. Then he issued a carefully written statement in which, evading the main charge of complicity in crime, he declared that the company was not a moral censor, and could not refuse to transmit racing or any other news that was couched in decent language. He entirely ignored the accusation that the Western Union gathered the news from the racetracks, sold it to the poolrooms, made special arrangements for eluding the police in delivering it, and kept inspectors busy to prevent leakages from poolrooms that paid for the news to other rooms that were trying to steal it. Nevertheless he was willing to reverse his position and become a moral censor if the civil authorities would request the company to withdraw its service from any particular poolrooms.

The inconsistency of this plea was pointed out by many commentators, especially by Police Commissioner McAdoo, who replied that President Clowry already had far more knowledge of the poolrooms than the police could possess. Western Union operators and instruments were in every room; the Western Union inspectors were on guard; and the Western Union treasurer received the daily tribute from the gamblers. If the company were really in earnest about purging itself, it need not wait for the Commissioner of Police, but could act on its own private information.

The discovery that the Western Union was an accomplice in crime was a severe shock to a number of worthy gentlemen in the directorate, who had not followed the details of operation, and who were keenly pained by the additional facts brought out in public discussion as well as by the severe comment from press and pulpit. Senator Chauncey M. Depew declared that unless the company set itself right, he would resign from the board; and everybody was aware that men like Morris K. Jesup and Jacob H. Schiff would never rest under the imputations that were laid against the Western Union. Mr. Schiff was abroad, but the common report—since confirmed—was that Mr. Jesup was demanding immediate action by the directorate. People were naturally surprised, therefore, when the Executive Committee merely endorsed President Clowry's utterance, shifted back to the police the responsibility for action against particular poolrooms, and promised that *hereafter* racing news should be furnished "only to such applicants as shall give assurance that it is not to be used for poolroom purposes." The resolutions of the Executive Committee obviously failed to meet the situation; they were a virtual admission that the Western Union was willing to cease co-partnership with felons only when the police had evidence against it; in other cases the company would continue to defy law and decency.

A more untenable position could scarcely be imagined. It was a confession of guilt and a refusal to reform except under compulsion. President Clowry found himself under a cross-fire from the press, from certain of his own directors who were less satisfied than ever with the conduct of affairs, and—worse than all—from the District Attorney. The wicked flee when no man pursueth, but, as is well known, a pursuer quickens the pace. By a curious coincidence the public received almost simultaneously two pieces of news: President Clowry, on his "own initiative," had discontinued the official delivery of reports of horse races to all classes of subscribers in the city of New York; District Attorney Jerome had begun an inquiry into the connection between the Western Union and the poolrooms. To establish a relation of cause and effect between these two facts is impossible. It is enough to remark that President Clowry threw to the winds his elaborate argument about the legal duties of a common carrier, discarded his objections to becoming a moral censor, and treated as so much waste-paper the unhappy endorsement of his own Executive Committee. In his latest utterances he comprehends the situation far more clearly than he did at first. In response to the question whether his company will lease wires to poolrooms, he declares emphatically: "Certainly it will not. When an application to lease a wire is made to us, we will inquire into the use to which it is to be put, and if that use is illegal we will refuse the lease. Poolrooms are illegal, hence we will do no business with them." Col. Clowry further asserts his right to annul the lease of a wire: "No contract is binding when it is in violation of the Penal Code and against the public good. Therefore we need not lease wires to poolrooms, and will not do so."

FRANCE AND THE VATICAN.

Of the Pope's circular note of protest against President Loubet's visit to Victor Emanuel III., there seems to be only one opinion, namely, that it was a grave mistake, and augurs ill for the future diplomacy of the Holy See. The pity of it is that the protest was evidently dictated by a sincere, if narrow,

piety, and the consequences of this ill-advised expression recall Père Hyacinthe's recent criticism, that "nothing is more dangerous in a Pope than piety when it is subject to the influence of a Secretary of State more or less of a Spaniard and a reactionary." As if to confirm this view, Mgr. Méry del Val's hand is thought to appear in an alteration of the circular letter. The version which reached the French Foreign Office lacked certain minatory phrases which went to all the other chancelleries of the Catholic world. Naturally, this suppression, once discovered, has heightened the offence.

Let us admit that, from his own point of view, the Pope was absolutely right in resenting a recognition of the usurping house of Savoy, which involved the disregard of the Holy See. President Loubet's visit must inevitably have been offensive to the Vatican. But it was highly inexpedient for Pius X. to seek a diplomatic remedy which was no remedy at all. A public reaffirmation of the temporal power, a measured complaint against the Trasteverine "captivity," would have shown that the Vatican yielded no point of principle. Such an encyclical need not have mentioned the French visit. The coincidence would have pointed the reference to President Loubet. A letter addressed only to the faithful would not have become a Parliamentary order of the day at Paris, whereas the circular note has already provoked serious reprisals in the withdrawing of the French Ambassador to the Vatican, and the whole matter will be laid before the Chamber of Deputies this week to add bitterness to the anti-Clerical agitation.

Already it is rumored that M. Combes will demand the denunciation of the Concordat, with the complete separation of Church and State in France. That he desires this may safely be assumed; that the French Republic can afford to give the Church its liberty, by withholding State support from it, is very doubtful. For Napoleon's momentous treaty of 1801 with the prisoner Pope Pius VII. was in some respects merely the logical formulation of principles worked out through many centuries of conflict between the Kings of France and the Popes. From St. Louis's time France had claimed the right of nominating bishops; Louis XIV. was ignominiously beaten on that issue, but Napoleon secured the important right beyond the possibility of reasonable dispute, and by nominating bishops under the Concordat France gains a national character for her Church, and guards against its undue political subservience to the Roman Curia. The agreement to pay a fixed stipend to the secular clergy arose naturally out of the Revolutionary theory of the Church as a function of the centralized State. The power to discontinue the stipend is the power to regulate the attitude of the priests towards the nation—to reward the loyal and to punish recalcitrants. At the comparatively slight expense of $10,000,000 a year, the Government of a country still profoundly Catholic at heart becomes at once the protector and the controller of the Church.

Imagine the Concordat abolished, and all moral claim to control would vanish. To-day, the Government peremptorily closes the convents and abolishes the Catholic schools, chiefly because the patron of the Church is necessarily its master. On the other hand, any attempt to regulate the bishops or the parish priests, after the Concordat had been abolished, would amount to tyranny. Now the Government has special rights over the Church; then it would have only the general rights it exercises over all citizens and associations. With Church and State fully independent, it would be as outrageous to interfere with Catholic education in France as it would be with, say, Methodist education in America.

As the case stands, the Catholic Church in France is in admirable condition for its work. Throughout the country parishes one finds curés not only of simple piety and saintly life, but also of fine education and breeding. No one who has observed the work of such men in the country towns, where in many cases the curé is maintained only by the national stipend, would wish to see their enlightening influence withdrawn. Often these men are about the only persons in a village whose life makes positively for morality or ideality of any kind. Largely because of the overt contempt of religion so prevalent in modern France, the parish priests generally have developed those heroic qualities which are the fruits of persecution. In the dislocation which would follow the abolition of the Concordat, the Church might suffer in tone. Many parishes would be abandoned, the missionary work necessitated by the change would be conducted not by loyal bishops, but in many cases by political bishops, eager only for ecclesiastical advancement. At some distant day the Church might be the better for regaining its freedom; for the present, one could anticipate only a considerable loss in spirituality and moral efficiency.

Over-clever persons, it may be said in conclusion, detect behind Pius X.'s gigantic indiscretion the instigation of the German *diabolus ex machina*. Nothing seems less probable. The Pope has simply done what seemed good to him as an unyielding potentate; it is not likely that he took counsel of any one. The result, of course, will be to turn the Vatican towards Germany because away from France. Far beyond the Roman Catholic Church, Pius's singularly ill-phrased and ill-timed letter will be regretted. Many who have deprecated a certain casuistical element in Leo XIII. will ask themselves, if, since the Vatican is inevitably in politics, there is not much virtue in a political Pope.

THE ARCHÆOLOGICAL INSTITUTE OF AMERICA.

NEW YORK, May 18, 1904.

On May 12-14 the annual meetings of the Council of the Archæological Institute of America, and of the committees of its affiliated schools — of Classical Studies at Athens and in Rome, and of Oriental Study and Research in Palestine—were held in this city, and brought together a notable body of scholars. The general meetings of the Archæological Institute, for the reading and discussion of scientific papers, are held, as your readers will remember, in the Christmas holidays. The Institute celebrates this year the twenty-fifth anniversary of its foundation, and may look with just pleasure on what it has accomplished—particularly on the present and promised future of its Schools. In membership the Institute has grown more rapidly during the last few years than ever before, and now has more than fourteen hundred members, in fifteen affiliated societies reaching from Boston to California. Two societies have been added in the course of the past year, in Colorado and in Southern California. The latter, with its headquarters at Los Angeles, is proving already one of the most active and vigorous of all, having within five months secured ninety members and an important collection of books and paintings (formerly the property of the Franciscan mission) as a nucleus for a museum, and entering heartily into the work of making phonographic records of Indian and Mexican music. The Institute has persuaded Mr. Arthur Farwell, whose acquaintance with Indian music is as intimate as that of any other American, to spend three months this summer at Los Angeles in the transcription and classification of these records, and Professor Stanley of the University of Michigan also hopes to give some time to this undertaking. That these musicians will have in many instances the opportunity to cause a song to be repeated by the singer, and need not trust entirely to a single phonographic record, will be recognized as a great advantage.

The addition to the Institute of several affiliated societies in the West naturally leads it to resume the greater activity in the field of American archæology which it exerted during the first years of its existence, particularly through the work of Mr. Bandelier. The resources of the Institute are so small in comparison with those of several museums and other organizations which are busy in this field, that it cannot vie directly with them, but it hopes, as in the past, to find within its means some important work which has been neglected by other agencies. At present the Institute maintains a fellowship in American archæology, the incumbent of which is living with the Mayas and studying their customs. In particular the Institute expects to exert needed influence and to attain important results through its affiliated societies in the West. At its recent meeting, the Council of the Institute created a committee on the preservation of monuments of American antiquity, and urged its societies in the West to take an active part in seeuring

measures to this end. As a national body, with societies in five of the Western States as well as in the East, the Institute has peculiar opportunities for obtaining information as to what is desirable and practicable, both from the men of science who are connected with museums, and from those who live in proximity to the monuments and know exactly what the condition of these is, and what are the threatening dangers.

For the last twenty years, the Institute has furthered research mainly through its schools. In the publication of the results of research, its chief enterprise has been its journal, the *American Journal of Archæology*. Together with its School at Athens, however, it publishes 'The Argive Heræum,' of which the second and concluding volume will be issued before the close of this year. It stands sponsor also for the masterly drawings by Mr. Bacon and Mr. Walker of the architectural remains at Assos, for the facsimile of the important Venetian manuscript of Aristophanes which was published a year ago, and for Professor Frothingham's expected work on the Arch of Trajan at Beneventum. At its recent meeting, arrangements were made for the publication of a quarto volume of papers of the American School of Classical Studies in Rome, a copy of which will be sent to every member of the Institute, and for a Bulletin of the Excavations at Corinth by the American School at Athens.

The changes made at the last meeting in the lists of officers of the Institute and its schools were slight. Professor Hoppin of Bryn Mawr will serve next year as associate to the director of the School at Athens, and Professor Carter of Princeton will render a similar service to the School in Rome, while Professor Schmidt of Cornell will be the director of the School in Palestine. Messrs. Harriman and Macmahon were appointed fellows of the School at Athens, and Messrs. Harmon and Van Buren received fellowships in the School in Rome. Professor White of Harvard was invited to represent the Institute at the twenty-fifth anniversary of the Society for the Promotion of Hellenic Studies, next July, and Professor Wheeler of Columbia was asked to be the representative at the Congress of Archæologists to be held in Athens next April. Mr. Arthur Evans of the Ashmolean Museum and of Crete, and M. Th. Homolle of Delphi and Delos and of the Museum of the Louvre, were elected honorary members of the Institute.

The next meeting of the Council and of the committees of the schools will be held in Boston next December in conjunction with the general meeting for the reading of papers. The change of the time of meeting from May to December was for the convenience of scholars whose homes are in the West and who cannot leave their work conveniently in May. A cordial invitation was received to meet in Washington, but this was not pressed, in consideration of the appropriateness of the Institute's celebrating its twenty-fifth anniversary in the city of its birth.

CORSICA AND ITS PEOPLE.

CORSICA, April, 1904.

In a previous letter I have written about Corsica as a land; let me now say something of the men who dwell therein.

The first question which a reader will ask is the question which in the Odyssey is always first asked regarding any race to whose shores the wandering voyager is driven: Are they savage, or are they friendly to strangers, and with a kindly mind? This question is quickly answered. The island, despite its reputation, is perfectly safe for a traveller, as safe as Massachusetts, safer than Missouri or Montana. There is still a good deal of murder going on. The vendetta remains; not, indeed, so frequent as when Mérimée wrote his novel of 'Colomba,' seventy years ago, not perhaps more frequent than in eastern Kentucky; but sufficiently frequent to excite little censure from the educated class and still to win the sympathy of the ordinary man. The family tie is extremely strong, and the sense of honor extremely susceptible, so that assassinations to revenge the slaughter of a relative or to wipe out an insult are pretty common. They are lightly punished, usually by three years' imprisonment, if the offender has not cared to make his escape to Italy. But this is the only sort of crime that is rife. The expression "bandit" denotes not a robber, but a man who, having killed some one, has taken to the *maquis* (heath), *i. e.*, has forsaken his village to hide in the tall heath scrub or low woodland which covers most of the island, and which is so impenetrable that twenty gendarmes may fail to find an outlaw in a single valley, and fail the more easily because he has usually the good will of the inhabitants. There is living at this moment in Corsica a famous "bandit," more than eighty years of age, who in his youth and middle age killed not a few persons, and who, after many adventures and various dealings with the French authorities, is now peaceably ending his days as a hero, or a national curiosity, whose photograph figures on picture postcards in all the shops of Ajaccio and Bastia. Most of the old *voceri*, rude popular ballads, sometimes striking in their forcible simplicity, turn on the vendetta; and one of the best known of these describes a girl who, being left the last of her house, with no male relative to carry on the family feud, devotes herself to avenging the death of her father.

Corsica is like Ireland, where, if you have nothing to do with the local troubles of the country—in Corsica as in Ireland they often turn upon land disputes—you can travel alone and unarmed everywhere. In Corsica, as in Ireland, robbery is disapproved, for robbery belongs to what the Irish call "dirty crime" (*i. e.*, crime unconnected with land questions or with politics), and the pride of a Corsican scorns the action. They are a proud people, with a high sense of independence and of personal dignity, and they have so recently emerged from a state of what was virtually private warfare, when everybody carried arms and used them freely, that their hot blood has not yet had time to cool. But they are not an unkindly or repellent people. People greet one another pleasantly on the road; the stranger is shown his way with friendly alacrity; the landlord gossips cheerfully to his guest about crops and the village life. They are not, however, so vivacious and so talkative as either the French of Aquitaine or the Italians of Tuscany; indeed, a comparatively taciturn people, not deficient in force or intelligence, but incurious, not much interested in the things of the mind, and far less industrious than are the peasants of Liguria or Lombardy.

There are few of them. With an area of 3,367 square miles (a little less than Porto Rico), Corsica has only 395,000 inhabitants (about eighty-eight to the square mile). Most of her surface is no doubt mountain or rough woodland, not fit for cultivation; but if the parts that are cultivable were developed, she could support a population three or four times as large as she has now. Not only are there wide tracts in the level east coast now deserted (owing to malarial fevers) which might be profitably tilled, but there are in many other districts hillsides fit for vine and olive and fruit trees which are left to be browsed over by goats, the mainstay of the peasantry. As the Corsican women have less personal beauty than those of middle Italy or southern Spain, so the Corsican man is seldom tall or striking in appearance. He has the strong face, the active frame, the quick movements of the mountaineer. But he doesn't like hard work. Seldom can he be induced to carry even a traveller's knapsack, though this may be partly due to his pride. He loves to sit in the sun in some open space on the edge of the village, with a group of others like-minded, discussing village affairs and, above all, politics. There is as much politics to the square yard here as in Greece or in New York. Nothing interests the Corsican so much. He does not read books; indeed, there are no bookshops outside Bastia and Ajaccio, and very few even in those towns. He does not care for beauty, for nothing can be less ornate than his house, within and without. There is not a moulding to the window, there is seldom a flower-pot in the room or a flower-bed outside. But he throws his whole soul into the getting and keeping of posts in the public service, especially local posts in the towns or villages, for this is what politics means. Laying its grasp upon the whole life, it pervades even business in the towns, and creates petty local factions everywhere. It naturally becomes associated with and intensifies the rivalry or hostility of families; indeed, it springs out of personal or family ambitions much more than out of any divergence of opinion on the controversies that distract the French Republic. Corsica forms a little world of its own, jealous of intruders, occupied by its local interests or passions. The bulk of the people would like to be Bonapartist, as they continued to be for a good while after the fall of the Second Empire. Now that the prospects of the scions of that family have died away, monarchical principles as principles have no great hold on the voters. Neither are they fervently Catholic, although more Catholic than their nearest French neighbors in Provence and Languedoc. But every election is contested with an immense zeal, and with an expenditure of money, not always a legitimate expenditure, disproportionate to the means of the electors and of the candidates.

Absorbed as Corsica is in herself, she has, nevertheless, no strong national feeling. The visitor is surprised at the want of it in a country so detached from the rest of the world, and a country which in the eighteenth century made so long and so stubborn a fight for freedom. A nation may be a nation, however small. The Ice-

landers, of whom there have never been more than seventy thousand living at one time, are a nation. So, one may almost say, are the Montenegrins, who, till the recent extension of their territory, were even fewer than the Icelanders. But the Corsicans have never had an independent political life as a people, nor a literature, nor an art, nor any political traditions filling the popular mind. They have shown, even in these days of the revival of historical memories everywhere in Europe, no interest in their language, or in their folklore, or in their history, or in their monuments, scanty and unimportant at best, that have come down from prehistoric or Roman or mediæval times. Only to-day is a society for Corsican archæology being formed by a few of the more educated. Yet they are a community standing apart, neither truly French (for, though they are well content to belong to France, France has not assimilated them), nor yet Italian. Their tongue, still generally spoken by the mass of the people, though most understand French also, is indeed an Italian dialect; but they have little intercourse with that country, and no sort of wish to unite themselves politically to the new kingdom. (The cry of "Italia Irredenta" has never included Corsica, which is more truly Italian than Trieste or any part of the Dalmatian coast.) They love not France the more, but Italy less, for Italy is to the Corsicans associated with the harsh rule of Genoa, against which they frequently rebelled, and from which they passed to France, after a short struggle to stand alone under the gallant Paoli, who comes nearest to being their national hero. In the eighteenth century there was no longer a chance for a small people.

Strangely obscure seem the annals of this island when one compares them with those of Sicily or even Cyprus. Corsica is scarcely heard of in ancient times. One splendid chance she had to become a centre of civilization in the western Mediterranean when the Greeks of Phocæa, preferring exile and freedom to the over-lordship of the Persian kings, left their Ionian home to plant themselves at Alalia on the fertile eastern coast of Cyrnus, as the isle was then called. The hostility of the fierce Etruscan sea-robbers, leagued with the fleets of Carthage, led them to abandon their settlement, and Corsica relapsed into darkness. She is seldom mentioned in Roman days, seldom in the Middle Ages. Few, indeed, were the persons of note that come from her down till modern times. The one who climbed highest was Formosus, a native of Vivario near Corte, who, as a leader of one of the factions at Rome, became Pope in the ninth century. A later Pope, exercising that amazing right which the chair of Peter claimed over all islands, and in respect of which Adrian the Fourth bestowed Ireland on King Henry the Second, gave Corsica to the Pisans, but they held only a part of it, and ultimately lost it to the Genoese. If it was ever really feudalized, the traces of feudalism have practically vanished. Few castles remain, and there are now scarcely any families uniting large possessions to social predominance. A spirit of equality reigns which is not wholly due to the republicanism of France, but recalls the communal system under which large districts seem to have lived in the Middle Ages.

Corsica makes to-day upon the visitors the impression of a country which has remained curiously detached from the main movements of European history. One must travel as far as Lapland in one direction or southern Russia in another to find a region with so little in it to recall the long past during which the peoples that are now most advanced have been struggling upwards into civilization. Even its towns, except the old quarter of Bastia and the villages (for one can hardly call them towns) of Corte, Calvi, and Bonifacio, have preserved scarcely anything of a character that can suggest the vicissitudes through which they have passed. It has no literature and no art. It is a piece of the early mediæval world which, until a century ago, had scarcely begun to share in the general progress of mankind. Such history as it has is a dim and doubtful record of petty conflicts. Only once has it affected the great procession of events, but on that one occasion it affected the procession of events to some purpose. That was when it gave birth to the great conqueror and administrator whose brief career changed the face of Europe.

MARSHAL DE LUXEMBOURG.—II.

PARIS, May 3, 1904.

Luxembourg's great enemy, Louvois, died almost suddenly on the 15th of July, 1691. Louis XIV. wrote a letter to the Marshal to notify him, saying: "I invite you in this conjunction to redouble your care and vigilance, in order that this event may not be prejudicial to my service, and to let me know directly, till further orders, all that may happen." Louvois was replaced as minister of war by his third son, the Marquis of Barbezieux, a young man, twenty-three years old, intelligent but inexperienced. It is clear that the King intended to take upon himself the chief conduct of the war. "There is no day," says Dangeau, "when the King does not work eight or nine hours." Madame de Maintenon writes: "The King gives two or three hours to hunting, when he can. He comes back at six and goes on to ten, without stopping, reading, writing, or dictating. He often sends the princesses after supper to answer some courier." The correspondence preserved at the Ministry of War confirms these words; one finds in it letters of fifteen to twenty pages, dictated every day by Louis XIV., corrected, annotated with his hand, written to the generals commanding in various countries. "Without containing broad views," says M. de Ségur, "or conceptions of genius, these letters are distinguished by constant good sense, lucid precision, studied moderation, justice, and impartiality, which, more than the brilliant ornament of his reign, ought to assure to Louis XIV. the esteem and respect of posterity." They are remarkable for great preoccupation with equity, great horror of the petty abuses of power—very rare qualities in a monarch. The dispatches sent to Luxembourg show us at times a familiar, easy, almost modest, Louis XIV.

"I am sure," he writes in one, "that you will form the best resolutions on the spot; as for myself, I can speak only by the map, and, if I am mistaken, you must not be embarrassed by my remarks, which are probably too distant to be just. . . . I take the affairs of my armies much at heart. It is not astonishing if I think of all that might happen. . . . I know that I am not teaching you anything in sharing my intentions with you. When we made war together we always understood ourselves well. It seems to me that the distance which separates us does not hinder our thoughts from having some relation with each other."

I omit details of the manœuvres and marches of the campaign of 1691. The Allies made great preparations for the following campaign of 1692. Louis XIV. resolved to besiege Namur, and left in person for the frontier, accompanied in great number by the ladies of the court. The great engineers Vauban and Coëhorn conducted the operations of the siege. Luxembourg had command of a large army, which protected the besiegers. The King had in his carriage on his way to Namur the Princess de Conti, the Duchess de Bourbon, and the Princess d'Harcourt; in the coach of the Duchess de Chartres were the Duchess de Gramont, the Duchess de Chevreuse, the Countess de Mailly. Madame de Maintenon travelled in a separate carriage, and behind her was a long series of carriages full of ladies in splendid dresses. They all dined and supped in the carriages. Madame de Maintenon distributed money all the way to the poor. This extraordinary procession, worthy of the talent of Wouvermans, lasted six days. The King held a great review for the ladies before the troops were sent to Mons.

After the siege of Namur the King had to undertake the siege of the citadel; William of Orange could not save it, and forbore to attack Luxembourg, who guarded the siege; the citadel was obliged to capitulate. Luxembourg encamped his army at Steenkerque, feeling very quiet there, when William of Orange endeavored to surprise him. He was much superior in infantry, and Luxembourg's magnificent cavalry could not well aid him on narrow ground. The military genius of Luxembourg never served him better; the account given by M. de Ségur of the battle of Steenkerque is equal to the best chapters of military writers. The flower of the French nobility was engaged in the struggle. "It was," writes D'Artagnan, "the most magnificent spectacle that could be imagined." The English battalions showed their usual bravery and doggedness. The Mackay division was entirely exterminated; nothing was left of its five regiments, the finest in England. The loss of the Allies was estimated at twelve thousand men; the French lost eight thousand men. Paris was overjoyed; all the fine ladies adopted the "cravate à la Steenkerque," as the Prince de Conti, one of the heroes of the day, had worn a long cravat of lace round his neck during the charges which he led.

William of Orange does not seem to have shown his usual qualities at Steenkerque. "Where were your generals?" said Luxembourg ironically, a few days after the battle, to an English prisoner. William resented his defeat with unusual bitterness. After two months of delay, spent in marches and countermarches, he returned to Holland, leaving the command to the Elector of Bavaria. Luxembourg left his army to Boufflers, and had a triumphant return to Paris. He became the hero of the capital. In one of the songs of the day we read:

> "D'honneur, je ne suis plus surpris
> Qu'Atlas portât le céleste lambris,
> Comme dit la *Métamorphose*;

Puisque nous voyons en ce jour
Que toute la France repose
Sur la bosse de Luxembourg!"

Luxembourg was slightly hunchbacked, and William alluded to it when he said that he never succeeded in seeing his back.

The ensuing campaign again brought Luxembourg and William face to face at Neerwinden. The account of this famous battle is even more dramatic, in M. de Ségur's volume, than the account of Steenkerque. This time William was attacked in his lines, which were a prodigy of camp fortification. Neerwinden was the central point; a triple assault of the place was necessary, and in the end, after repeated charges of cavalry, it remained in the hands of the French. The two sons of the Marshal were wounded under his eyes. William was obliged to give the signal for retreat. A panic seized a part of his troops, and a terrible slaughter took place in consequence. William, as firm and calm in defeat as in victory, rapidly repaired his losses, and, to the general surprise, Luxembourg made no move after his victory. His army was not paid regularly; several regiments were on the eve of mutiny. It was time to place the French troops in winter quarters.

Luxembourg returned to Paris. He was very coldly received at Versailles by the King and by the court, but he consoled himself with the ovations of the populace and the fanaticism of the army. The marshal had a proof of it when, the day after his return, he went to Notre Dame, where a Te-Deum was sung for the victory of Marsaglia (that of Catinat over the Duke of Savoy, on the 4th of October, 1693). From the vaults of the old cathedral hung, according to the fashion of the time, the flags captured from the enemy during the preceding years. Never had the vaults been adorned with such a profusion of standards; and of these hundreds of trophies, attesting the glory of our arms, Fleurus, Leuze, Steenkerque, and Neerwinden had furnished the better part When Luxembourg arrived for the ceremony the attendance was complete; an immense multitude filled the church and its entrance. Frail, weak, of small size, Luxembourg had some difficulty in cutting his way through. The Prince of Conti was not far off. He goes to the Marshal, seizes him by the hand, and, showing him to the bystanders, "Make room," he shouts loudly, "make room for the *tapissier de Notre Dame.*" The words went echoing from mouth to mouth: "Room for the *tapissier de Notre Dame.*" The crowd, respectful and docile, opened its ranks, formed an alley with all heads uncovered; and, amid acclamations, advanced the man who incarnated at the time the fortune of France.

After painting the man of war, M. de Ségur paints the courtier, makes us acquainted with his private life, his pleasures, his tastes, his principal friends. These were all "libertines," men of pleasure—Albergotti, a Florentine who had entered the French army; the Marquis de Cavoye, the Count de Gramont, Roquelaure, a sort of buffoon. It is surprising to find the name of Racine among these. Louis XIV. said with a smile: "Cavoye with Racine thinks himself a *bel esprit*, and Racine with Cavoye thinks himself a courtier." But Racine may be believed when he wrote to Madame de Maintenon: "I dare say that the *grands seigneurs* ran after me much more than I after them; but, in whatever company I found myself, God gave me the grace never to blush at the name of the King or of the Gospel." The most intimate friend of Luxembourg was the Prince de Conti, the nephew of the great Condé, the brave soldier of Steenkerque and Neerwinden, "the most amiable and seductive of men," says Saint-Simon. "He was the Germanicus of our time," exclaims Saint-Simon. Luxembourg and Conti formed a sort of association and cabal to control the Dauphin, as the health of Louis XIV. was becoming precarious. M. de Ségur enters into many particulars as to the complicated intrigues Ségur established between the Princess de Conti and Mademoiselle Choin, the mistress of the Dauphin; he also speaks at length of the long trial of precedence which took place in the Parlement between the dukes and peers.

The opening of the campaign of 1694 interrupted this debate, and Luxembourg had to return to Flanders. The state of his finances obliged Louis XIV. to reduce the strength of his armies, and Luxembourg was constrained to act purely on the defensive. He succeeded in paralyzing by his manœuvres the forces of William of Orange.

The campaign ended to the satisfaction of the King, without any appreciable results for either party. On his return to Paris, Luxembourg occupied himself with his personal affairs, always in a state of great confusion, when he fell suddenly ill with pneumonia. The Marshal asked at once for Bourdaloue and for Fénelon. They both saw him in his last moments. The public consternation was great; it seemed to all as if the fortune of France was gone with the "tapissier de Notre Dame." Fifteen days after his death, however, Madame de Coulange wrote to Madame de Sévigné: "You may believe, madame, that nobody here imagines that there was but one M. de Luxembourg in the world; his best friends still meet often; the pretext is to cry, and to drink and eat and laugh and find themselves good company; and 'de Caron pas un mot.' So the world is made—the world we still like."

Correspondence.

THE SEACOAST OF BOHEMIA.

To the Editor of The Nation:

Sir: The idea of giving a seacoast to Bohemia did not originate with either Greene or Shakspere, but occurs in an earlier work, 'Florambel de Lucea,' as may be seen from the following piece of information extracted from it by Clémencin in his edition of 'Don Quijote' (Vol. III., p. 381):

"After sundry acts of prowess they landed in a seaport of Bohemia called *Esterlin.*"

The association with Hungary on a following page proves that the real Bohemia was meant. An extract from another book ('Emperor Esplandian') about California—this time an imaginary country—given on page 385 of the same volume, will probably interest American readers. O. T.

Notes.

The Librarian of Congress informs us that the Library is about to publish the first volume of a History of that institution, by Mr. Dawson Johnston.

The Irish Texts Society makes the satisfactory announcement that its Irish-English Dictionary, long in preparation, will be ready in August of this year. "It is estimated that the work will comprise nearly 800 pages, crown 8vo. It contains a far larger number of words used in the living Irish language and in the more modern written compositions than any Irish dictionary yet published. It is the first analytical dictionary of the language. The gender, genitive and plural are given with each noun, and copious examples are added of idiomatic forms, and especially of the employment of the various particles, whose uses and functions offer special difficulties to the student. The irregular verbs are illustrated by paradigms. In many cases the authority for a particular word is given, and the part of the country in which the word or expression is in use is indicated." The price will bring the work within the reach of all students. A specimen page shows that the type (brevier) is as clear as could be expected in a book meant for general use. If we may at all judge by this page, the dictionary will be an immense advance upon O'Reilly's, the only one heretofore available. With this and Fournier's English-Irish Dictionary, lately published, the older generation of those who have struggled with the difficulties of Irish will have reason to envy present-day beginners.

In June, the Macmillan Co. will publish the fourth volume in the Cambridge Modern History series, viz., 'The French Revolution,' and in the autumn the official biography of Burne-Jones.

Cassell & Co. are about to publish a 'Cyclopædia of Mechanics,' in eight volumes, edited by Paul N. Hasluck and copiously illustrated; and have already begun issuing in parts an illustrated 'History of the Russo-Japanese War.'

'Southern Thoughts for Northern Thinkers,' by Mrs. Jeannette Robinson Murphy, a collection of humorous negro stories, folklore, and articles upon the negro question, will be bound up with some thirty slave songs gathered by the author in her native Kentucky, together with "several essays upon the origin of this barbaric music and how to sing it." It will bear the imprint of the Bandanna Publishing Co., No. 361 West Fifty-fifth Street, New York.

Little, Brown & Co. have nearly ready 'A Treatise on American Railroad Law,' by Judge Simeon E. Baldwin.

'Our Common Schools: Their Administration and Supervision,' by William E. Chancellor, is in the press of D. C. Heath & Co., Boston.

A second book on animal life by Prof. Charles G. D. Roberts, entitled 'The Watchers of the Trails,' is announced by L. C. Page & Co., Boston.

A study of the nature of the borough in the minds of the Domesday valuers, 'The Domesday Borough,' by Adolphus Ballard, town clerk of Woodstock, which the Oxford University Press is on the eve of bringing out, is based on an independent collation of the Domesday evidence.

The majority of names in Esther Singleton's 'Japan as Seen and Described by Great Writers' (Dodd, Mead & Co.) are those of transient tourists or of persons having little or no acquaintance with the history and language of the country. Yet, on the other hand, such writers may give more vivid impressions. The extracts are arranged under the heads of Country and Race (without any reference to Satow), History and Religion (without any reference to Knox and other writers on religion), Places and Monuments, Manners and Customs, Arts and Crafts, and Modern Japan. The illustrations are numerous and excellent, reproduced from well-known photographs, and the selections are for the most part proportionate and in good taste. The editing and proofreading, however, are none of the best. Some of the French spellings, like Foudji (Fuji), Daiboudhs (Daibutsu), etc., in a book which is said to be both "edited and translated," are shockingly off from the standard which has been in use for now more than thirty years. A sentence describing *saké* as "fermented drink, rice brandy," is hardly in order from the point of view of science. Some of the photographs are wrongly marked. For example, the "Shinto Temple, Kobé" is nothing else than the familiar tomb of Kiyomori, which stands in the yard of a famous Buddhist temple. Some of the statements of Humbert, who wrote nearly forty years ago, are obsolete and anachronistic. To speak of Nijo (which was the Shō-gun's) as "the Mikado's palace in Kioto" is much the same as referring to the palace at Versailles as the German Emperor's. Such a book as this should have an index. It is neatly printed, handsomely presented, and contains much valuable and informing matter.

The photo-engraving processes have not often been turned to better account than in the beautiful treatise, 'How to Make a Flower-Garden' (Doubleday, Page & Co.). Professor Bailey furnishes an attractive introduction, full of good sense and wise counsel, and contributes also a few short and instructive papers of a practical character. The rest of the book is a patchwork of most uneven quality. A few of the contributions are of a high order, while some are not at all in that class. But this was to have been expected when more than forty writers set about making a small treatise on gardening. The editor of such a treatise must be held blameless, for he cannot rewrite *all* the articles offered: the most that he can be required to do is simply to see that no misleading advice finds its way into the pages. So far as a careful perusal has gone, no serious errors of statement or advice have been detected, and the book as a whole can be recommended as both charming and useful.

In 'Trees and Shrubs,' Part III. (Houghton, Mifflin & Co.), Professor Sargent continues to make excellent use of the remarkable skill of the botanical artist Mr. Charles E. Faxon. Twenty-five "new or little known ligneous plants" are here brought under Mr. Faxon's pencil. In addition to the accompanying descriptions given by Professor Sargent, notes are presented by Messrs. Greenman, Rehder, and Shaw, the whole making an interesting as well as important contribution to dendrology. In this group of twenty-five species, *Cratægus* (Hawthorn) claims a prominent place, arrogating to itself eight of the plates. This genus has been of late undergoing a process of splitting-up until it seems to bid fair to become the terror of herborizers, very much as brambles now are in the Old World. The Southern species of *Cratægus* are numbered by the hundreds in a recent book, and the work has perhaps only just begun. It is likely that other polymorphic genera will now have to take their turn at disintegration; if so, it is to be hoped that the *disjecta membra* can secure as their pictorial recorder as accurate an artist as Mr. Faxon.

Mr. A. W. Verity has just added 'Hamlet' to his well-known editions of Shakspere's plays (The Macmillan Company). The scholarly character of these editions has been generally recognized, and the present volume is worthy of its predecessors. Indeed, the very full and careful Notes seem to us superior to those of any of the editions for college use now on the market. It is rather surprising to an American, however, to note, in a book that is evidently intended for advanced students, practically no references to recent German works relating to Shakspere. For example, we observe no citation of what is now undoubtedly the standard authority on Shaksperean grammar—namely, Franz's 'Shakespeare-Grammatik': and Abbott still seems to be the editor's guide in such matters. Similarly, König's treatise on Shakspere's versification—a work which was executed under the supervision of the late Professor Ten Brink—surely deserves a mention by the side of Abbott's less exhaustive treatment of the same subject. The same criticism might be extended to Mr. Verity's discussion of Hamlet's character, in which Dr. Loening's interpretation, that has made such a noise in the world, was worthy of a passing reference at least, if not of more. Finally, when the editor decided to devote four or five pages of an appendix to the famous Elizabethan stage-quarrel, with citations of the literature of the subject, he should certainly not have omitted to mention the most acute and learned book dealing with that controversy, namely, 'The Stage-Quarrel between Ben Jonson and the So-called Poetasters' (Breslau, 1899), by our countryman, the late Dr. R. A. Small.

Whoever likes to have some tolerable conception of the practical problems connected with things that he daily deals with, will be interested in a fairly readable little book entitled 'Electric Traction' (Whitaker & Co.), by John Hall Ryder, the chief electrical engineer of the London tramways. It discusses such details as controllers, conduit systems, accumulators, etc., from the point of view of a man in a high responsible position. The work is, to be sure, calculated for the meridian of Greenwich; but that only adds to its interest, especially as the author never loses sight of American practice, which indeed would be quite impossible in the field of electrical engineering. In special parts of that field Germany and France are in advance of us, although it is admitted that we lead on the whole. How backward England is in some respects is shown by Mr. Ryder's considering only direct-current dynamos, though the alternating system is used on the Manhattan Elevated, and though the majority of recent advances have been in that direction. On the other hand, he seems to have the best of the argument in condemning our conduits midway between the rails.

The new edition of Hawkins and Wallis's 'The Dynamo' (Macmillan) is, on its practical side, a new work. The first edition, which preceded this by just ten years, and which was in its day an admirable compendium, is now as much out of date as Johnson's Dictionary. The new edition, though double the size of the first, is relatively hardly as full, in view of the art's advance. It is easily the best book on the subject, but does not enter into the minutest details.

Prof. William Henry Boynton's 'Applications of the Kinetic Theory' (Macmillan) is a work comparable with the main text of Oscar Emil Meyer's celebrated treatise, from which it differs by its superior brevity, but chiefly by the study it gives to liquids. It is as lucid as possible. The author disclaims all originality, but he has performed his task with very marked ability. Yet we must protest against his narrow point of view. The theorem of the virial, which ought to be the very root of the whole tree, is barely mentioned, and is called an "abstraction." We cannot see the justice of this. Are students of physics supposed to be babies? Certainly, it is desirable to present the subject free from all the intricacies that Boltzmann and Burbury have introduced into it. But the theorem of the virial, instead of raising the difficulties and doubts that a too minute examination will bring out, enables the student to dispense with several arbitrary and almost absurd hypotheses. Prof. Boynton ought to reconsider that matter for another edition.

The volume which M. P. Alphandéry entitles 'Les Idées Morales des Hétérodoxes Latins au début du XIIIe' Siècle' (Paris: Leroux), is a creditable résumé of recent research on the heresies which preceded the rise of the great Mendicant Orders, although it presents little if anything that is strictly new. The title is somewhat too restricted, for the moral conceptions of the heretics form but a small part of the subjects discussed, and it seems to have been adopted in conformity with the thesis that the heresies originated in a general popular desire for moral elevation which the Church, absorbed in consolidating its temporal power, neglected to furnish. It appears somewhat odd to find (p. xxv.) Innocent III. characterized as the first jurist to mount the papal throne, when Alexander III., the author of the 'Summa Rolandi' and of the 'Post Concilium Lateranense,' has already injected so much of the imperial jurisprudence into the canon law.

Gaston Paris died over a year ago, but obituary notices and appreciations of his work continue to be published in great number. Two of these are of especial interest—one by his successor at the Collège de France, Joseph Bédier, 'Hommage à Gaston Paris' (Paris: Champion), and a second by the most distinguished of Italian scholars, Pio Rajna, 'Gaston Paris: Discorso letto alla R. Accademia della Crusca' (Florence: Tip. Galileiana). The latter is especially concerned with Paris's relations to Italy and to Italian literature, and is enriched by numerous citations from letters to Amédée Durande and to Rajna himself. The former is the set *leçon d'ouverture* delivered on assuming the vacant chair in the Collège de France, and insists especially on the work of Paris in diffusing the scientific study of the French language and literature, and on his great influence in this direction, both in France and elsewhere.

Precision of philological method M. Paris could communicate to his disciples, but few of them have as yet given evidence of the keen literary taste or the broad historical perspective that characterized their master.

The thirty-three years' work of the Bureau of Fisheries, described by Dr. B. W. Evermann in the *National Geographic Magazine* for May, shows remarkable scientific and economical results. It began when Prof. Spencer F. Baird, the first commissioner, established his headquarters at Woods Hole to investigate the causes of the decrease of food-fishes, and served without a salary till his death in 1887. The *Albatross*, "the first vessel ever built expressly for scientific work along biologic lines on the high seas," and still the best equipped, was launched in 1882, and her five years' work on the Atlantic Coast and sixteen in the Pacific, especially that directed by Professor Agassiz, has commanded the attention of the scientific world. On its collections alone have been based "about 100 new genera and more than 2,500 new species." One of the economic results of the Bureau's work is that the annual value of the fisheries through artificial propagation is three million dollars. The conclusion reached is that "cultivation of the coastal and interior waters is as possible and imperative as is cultivation of the land, and promises quite as rich returns. An acre of water can be made even more productive than an acre of land." In the same line is the successful method of inoculating sterile ground with nitrogen pursued by the Department of Agriculture. A small package of germs, like a yeast cake and costing about two cents, will suffice to endow the seeds of leguminous plants for one to four acres with marvellous power. The process of manufacture has been patented by its discoverer, Dr. George T. Moore, and by him "generously deeded to the American people." These articles are well illustrated, and that on the geography of Alaska is accompanied by the new Government map of that territory on the scale of forty miles to the inch, with 1,000-foot contours.

The history of poultry-raising and egg production in Denmark, as told in the Consular Reports for May, is full of suggestion for our small farmers. Up to within a few years the keeping of hens was regarded by Danish farmers as a necessary evil, and the few they kept received little or no attention. By means largely of co-operative societies for instruction in breeding and packing, and providing a market, the export of eggs, which began in 1867 with a few score thousands, was in 1902 thirty-six million dozens, worth $6,451,000. The Coöperative Egg Export Association has a membership of 33,500 farmers, divided into 500 local societies, the member's admission fee being thirteen and one-half cents. A noteworthy feature of this number is the references to great public works proposed in various countries. A plan for a "Longitudinal Railway," 1,200 miles long, running parallel with the coast, with sixteen branches and other railways and hydraulic works, at a total estimated cost of $93,440,000, has been submitted to the Chilean Congress. A recent convention of grain-growers has recommended the construction of a railway from Winnipeg to Hudson Bay in order to open up a vast tract of undeveloped grazing and wheat-growing land. An abstract is given of a report of a Russian engineer on the proposed Riga-Chersonese Canal uniting the Baltic and Black Seas, and bringing Odessa within twelve days' sail of St. Petersburg instead of forty-two as now.

A curious specimen of ancient superstition appears in a divination discovered by Professor Vitelli of Florence in an Egyptian papyrus of the Imperial period, and published by him in the *Atene e Roma*. In this writing we are concisely informed, in simple Greek, what pulsations felt in various parts of the human body signify. For example: "If the pulsation is felt in the right knee, this, as a general thing, indicates misfortune; in the case of slaves, it signifies something good; in the case of a young maiden, that she is being slandered; in the case of a soldier, some profit; in the case of a widow, joy. Pray to Chronos. If the pulsation is felt in the left knee, this, as a rule, indicates dissatisfaction; in the case of a slave, freedom; in the case of a maiden, marriage; in the case of a widow, a feast; in the case of a soldier, advancement. Pray to Demeter." The new find is the first specimen of this kind of literature that has ever been discovered. The names it assigns to the different parts of the body have an interest for the philologian and the student of medicine.

Hundreds of applications for a Chinese translation of the 'Encyclopædia Britannica' have been received by the representative of the Christian Literature Society for China at Shanghai. This striking indication of intellectual progress is doubtless due largely to the fact that, at the examinations for degrees, such questions as these are common: "Explain free trade and protection." "Wherein lies the naval supremacy of Great Britain?" "How do foreigners regulate the press, post-office, commerce, railways, banks, banknotes, taxation; and how do they get faithful men?" The publications issued by the above Society last year amounted to 36,000,000 pages; while pirated editions of many of the Society's books were published in several parts of the empire.

Egypt's industrial growth is indicated by the fact that the water gained by the building of the Assuan dam is insufficient to supply the demand. The Government is reluctantly compelled to refuse further applications for water. To meet this want, Sir William Willcocks, the great irrigation engineer, advocates the creation of a modern Lake Moeris in the depression to the south of the ancient lake which for more than 2,000 years served to control the floods of the Nile.

Mr. William Beer, librarian of the Howard Memorial Library, New Orleans, informs us: "The subject of the native French literature of Louisiana has received comparatively little study up to the present, from want of any adequate catalogues. Permit me to point out that the Exposition Française de la Louisiane, which represented the survival of the French spirit in that State, placed before the world an almost complete collection of the native literature. The catalogue of that exhibit included a list of French newspaper literature which had never previously been collected."

—'Writings on American History, 1902,' by Ernest C. Richardson and Anson E. Morse, is the first issue of what it is hoped may be a series of annual volumes devoted to the current bibliography of American history. "American" is interpreted to include the Americas; the present work attempting to cover the literature "exhaustively as regards the United States, rather fully for British America, and less fully for Latin America." Such a list is so welcome an addition to the historian's tools that one may well be glad to have it in any form, but the form and method are, unfortunately, subject in this case to serious exceptions. The editors have chosen the alphabetical subject form for the entries, dispensing altogether with the alphabetical author entries save under the several topics. For general use—and the editors seem to have had college undergraduates and the uncritical public especially in mind—this method has obvious advantages, provided one knows the subject under which the writings he desires have been listed; otherwise he may have to hunt for it. The topical subdivision here is minute, and a classified index, not alphabetical, may aid consultation; but the analysis is not complete, and there is a dearth of cross-references. Thus, information about the much discussed interoceanic canal will not be found under either "canal," "Panama," or "Nicaragua," but under "Isthmian Canal," while the seeker for the literature of "Expansion" will find it under "Imperialism." In the absence of an alphabetical author list, it is of course impossible to follow the works of any one author through the index. The decision of the editors to attach to each topic a brief description or explanation, whether necessary or not, is amazing. Who that will ever use the book needs to have agriculture, banks, almanacs, or undertakers defined for him, or be told that Massachusetts is "an original N. E. State of the United States," and New York the "metropolis and chief port of America, on New York Bay"? The critical estimates accompanying the principal entries are generally well chosen, but of course highly condensed in presentation. No attempt seems to have been made to list important United States documents as a whole, and State publications seem also to have been as a rule excluded. There is a list of important "periodicals and transactions" (pp. 165-168), with in each case the number of the published volume for the year, but there is no index of contents save as the contents are distributed through the subject classification. We have not searched the book for errors or omissions, but we note that Miss Kimball's 'Correspondence of the Colonial Governors of Rhode Island' is twice entered, pp. 184 and 185, with different descriptive data in each case, and that the Christian name of Nathanael Greene is misspelled (p. 85). On the whole, we must repeat that we are glad to have the book, and that it will unquestionably prove of great usefulness, but we wish its scope had been more comprehensive and its execution more scholarly.

—Senate Document 74, Fifty-seventh Congress, second session, consisted of two volumes, which together comprise by far the best and most complete bibliography of the Philippine Islands in existence. The standard works hitherto, in fact the only works worthy the name of Philippine bibliogra-

phy, have been the rather scattered lists which W. E. Retana has issued in the form of a catalogue of his own library of Philippina, and in connection with his republication of old Philippine sources, and the somewhat more systematic bibliography of J. T. Medina, a Chilean, printed in 1897. Both these compilers worked in Spanish. Besides the incompleteness of Retana's work, everything he did is tinged with a bitter anti-Filipino and pro-friar bias; Medina is more scholarly and on the whole more reliable, but his work, begun in connection with Mexican bibliography, is incomplete, comprising 667 numbers. The first part of the Senate document mentioned above, which is composed of a list of books and maps on the Philippine Islands, to be found in the Library of Congress, approximates 1,500 titles up to 1898, aside from the books, Congressional and other public documents, and articles in periodicals issued since then. The second part of the work, which has also just been issued separately by the Library of Congress, consists of a Philippine bibliography by Dr. T. H. Pardo de Tavera of Manila, who is now one of the Filipino members of the Philippine Commission. His father was one of the deportees in connection with the revolt of 1872, and the son lived with his mother for some years in Paris, studying there and elsewhere on the Continent, not only in his profession of medicine, but also in Oriental and especially Malay languages, and in everything pertaining to the Philippines. He is a member of various learned societies of France and Spain, and, the past having been forgotten, was recognized with certain royal orders by the court of Spain, and, being of nearly pure Spanish blood, was quite generally identified as a Spaniard before the insurrection of 1898. He preferred, however, after the fall of Spanish sovereignty, to identify himself with the Filipinos, and has been almost from the first one of the most consistent and prominent of the "Americanistas" in the archipelago. He will visit this country shortly, along with the Filipino commissioners to the St. Louis Exposition. He possesses in Manila what is undoubtedly the largest private library of Philippina in existence, with the exception of that of Señor Retana, which numbers, or once numbered, 2,697 titles, including manuscripts.

—In preparing this bibliography, which is entitled 'Biblioteca Filipina,' and is printed in the Spanish just as the manuscript was sent by Dr. Tavera and placed at the disposal of the Librarian of Congress in 1901, he has used as a basis his own library, supplementing it with the works of Medina and Retana, and with notes taken from the old works in his possession, or made in the libraries and archives of London, Paris, Madrid, Seville, and Manila (he having had some access to the friar archives in the latter city until he became identified with the United States). His work comprises 2,850 titles, though, under the system adopted, there is some duplication. The system adopted is, as a matter of fact, hardly a system at all, being merely alphabetical, with some cross-references, and with practically nothing like the subject-classification which the modern bibliographer considers essential. In this respect the Library of Congress bibliography prepared by Mr. Griffin, the able bibliographer of that institution, will serve as a valuable check upon the work of Tavera. Perhaps the chief value of the latter work consists in the comments made by the compiler upon all works of importance, or works which incurred his disapprobation or sarcasm. It is here that his semi-Spanish education asserts itself, in spite of the fact that he rejects his Spanish connections; and the inexpert reader needs to be warned that the studious doctor's comments are not always unprejudiced. They are, however, always spicy, and will not detract from the interest of the work nor from its value for consultation, even if some of the remarks would be placed under the ban in any German, English, or American work of the sort. His biographical notices are also of value, though one detects errors, and occasionally the bibliographer of the Library of Congress has inserted possible corrections in brackets. Doubtless there was some difficulty in working with the Spanish manuscript of Dr. Tavera, but the many and repeated errors in spelling, accentuation, and of a more serious sort are not creditable to the Government Printing-Office. Surely, any sort of proofreading should have prevented the exchange of entire words for others which mean something else or nothing at all in Spanish.

—The 'Clarence King Memoirs,' published for the Century Association of this city by G. P. Putnam's Sons, is a less satisfying monument than would be the work of a single hand. Consisting of the contributions of many friends, written only in part expressly for the present occasion, it necessarily offers some repetitions along with much diversity of style and power of appreciation. It is, however, altogether readable, with at least a borrowed lightness; and while all the main biographical facts are recorded, there is an illuminating display of the facets of a many-sided and brilliant character. The man is rather more in evidence than the geologist, but Mr. King's rank in this capacity is weighed by his associate, Mr. S. F. Emmons. Another, Mr. J. D. Hague, contributes a long gloss on King's tale, "The Helmet of Mambrino," with which the volume opens, exhibiting the whimsical personality of the "Don Horacio" of that humor. Mr. Hague also concludes with some choice Memorabilia. Other contributors are Messrs. John Hay, W. D. Howells, Henry Adams, John La Farge, Edmund C. Stedman, W. C. Brownell, Edward Cary, D. C. Gilman, and Rossiter W. Raymond—a notable company. There are several portraits of King, whose charm was, after all, incommunicable. One of his artistic jests was in reply to Ruskin's offering him his choice of Turner's two greatest water-colors—"One good Turner deserves another"—and he got both. With a like generosity he gave a Fortuny to Mr. Howells. Among his adventures in the field was one with a grizzly in his cave in the manner of General Putnam with his wolf. Another was his receiving from a mother unable to board the train in crossing the Isthmus of Panama, a baby, which he had to farm out to a colored woman between trains. The sequel is a ghost story, and the restoration to this nurse of her runaway son, who had drifted into Mr. King's employ.

—Adam & Charles Black, London (New York: Macmillan), publish 'The Life of Jesus,' by Dr. Oscar Holtzmann, in a translation made by J. T. Bealby, B. A., and Maurice A. Canney, M. A. That the translation is approved by Dr. Holtzmann is not, perhaps, its best possible recommendation, but the book reads quite as if it had been written in English in an agreeable style. It is a big octavo of 542 pages, but compactly written as compared with Keim's elaboration of the subject in six volumes. The author must be distinguished from his relative, H. J. Holtzmann, a scholar of much greater reputation. His book was published in Germany in 1901, and was received with a degree of favor that makes its translation into English a natural event. Its place is very distinctly with the more liberal biographies of Jesus, and, as distinctly, not with the most radical. Its dealing with the sources of our knowledge of Jesus is far less discouraging than the criticism of Professor Schmiedel of Zurich, who is much in favor with the editors of the 'Encyclopædia Biblica.' A striking feature is the liberal use made of the Gospel of the Hebrews, which is put on a level with the Synoptics and much higher than the Fourth Gospel, which is severely depreciated both as to the discourses attributed to Jesus and the order of events, though some genuine elements of tradition are conceded to it. There is much chronological particularity in Dr. Holtzmann's presentation, which is the more convincing because he finds it easy to accept uncertainty where that seems inevitable. Thus, for the birth of Jesus he attempts no greater exactness than this: "His birth took place (let us say) some time in the last decade (14-4 B. C.) of the reign of Herod I." The birth-stories of Matthew and Luke are utterly discredited. "Jesus was born at Nazareth in Galilee, being the eldest of a family of five brothers and several sisters, and there he grew up." In general the miracles of Jesus are treated in a highly naturalistic manner; their credibility in some cases being based on modern psychical phenomena of doubtful character. The resurrection of Jesus is minimized as a subjective experience in the minds of excited men and women. The tendency of recent criticism is certainly to the denial of any "Messianic consciousness" in Jesus. At this point Dr. Holtzmann is reactionary, dating such consciousness from the baptism of Jesus and a visionary experience.

PAUL'S MODERN ENGLAND.

A History of Modern England. By Herbert Paul. In five volumes. Vols. I. and II. (1845 to 1865). The Macmillan Co. 1904.

The writer of contemporary history, or of history so recent as to be virtually contemporary, is exposed to three difficulties. The materials at his disposal are and must be insufficient to explain many of the events he has to describe, because some of the most important—those which reveal the secret motives of the men whose action determined the course of events—have not yet been given to the world. Any one who watches with intelligence what passes under his own eyes, knows that the record in the newspapers of the doings and words of men is very far from explaining the real significance of those doings and words. Whoever has a personal familiarity with the individuals that figure in political life, knows that the popular impression of their character is frequently quite erroneous, and

many years may elapse before the data necessary for judging them correctly are disclosed. A second and not less obvious difficulty is the political or personal bias which affects a writer when he discusses events still within the sphere of party controversy. Even the annals of the sixteenth and seventeenth centuries are viewed with different eyes by a Roman Catholic and by a Protestant historian in Europe. Even the events of the days of Andrew Jackson are seen with different eyes by a citizen of Massachusetts and a citizen of South Carolina. Much more, then, must an Englishman be exposed to the influences of party feeling when he describes the strife of Whig and Tory in the days of Mr. Disraeli and Lord John Russell. The third difficulty is still graver. Events take a long time to fall into their true historical perspective. Some which, not only at the time when they happen, but for a good while afterwards, appear to be of the first importance, are subsequently reduced to much smaller proportions. Others, little noticed at the moment, are afterwards perceived to have been of great significance. An act of policy which at the moment seemed wise, or at any rate necessary, may be condemned by results which are not fully revealed for many a long year. Another act, generally censured at the time, may be justified by its ultimate fruits. To take two obvious instances: the hour has not yet arrived at which a final judgment can be passed upon the grant of suffrage to the colored people of the South in 1870, or upon Mr. Gladstone's Home Rule bill of 1886. There is no event recorded in these volumes about which people are now more generally agreed than that the Crimean war of 1853-55 was a blunder, but it was not till thirty years later that this was recognized.

Nevertheless, patent as these difficulties are, recent history has got to be written; and some of the greatest books of history the world possesses have been written by men practically contemporary with the events they described. They are, indeed, the most interesting books, because they convey the very life and color of the time. Thucydides, Tacitus (in his 'Histories'), Procopius, Matthew Paris, Philip of Commines, Clarendon, Burnet, are familiar instances, Mr. Paul, who is well known in England as a practised and brilliant writer, and who was for some time a member of the British House of Commons, knows the difficulties. Let us see how he grapples with them.

As respects the use of unpublished materials, it is not easy to form an opinion, for he seldom quotes his authorities, and he may have made a greater use of oral tradition or of letters and diaries still in manuscript than the reader is told. The scale of his book, which covers twenty years in less than 800 pages, does not permit the minute discussion of the underlying motives of the chief actors. This much may be said, that in reading it we have not found any statement which a fuller knowledge of unpublished sources seems likely to refute or materially to modify. More data will, of course, be available to later writers, but Mr. Paul seems to have used well the data already possessed. Nor as respects personal bias is any serious complaint to be made. It is indeed easy to discover Mr. Paul's own views. He is in politics a decided Liberal, and in ecclesiastical matters what is called in England a pronounced Broad Churchman. A man of more conservative views, whether in State or in Church questions, would no doubt write differently. But he is not unfair; that is to say, he desires to do justice to those with whom he differs, and is willing, on proper occasions, to blame the conduct of Liberal statesmen. Perhaps, however, it would have been well if he had from time to time paused to set forth rather more fully the views and what may be called the general mental and moral attitude of the Conservative or Tory party. Indeed, there is not in these volumes quite enough of an analysis or picture of the phases of English opinion. Attention is concentrated on the men; but the environment of doctrine and sentiment which influenced them and which has varied a good deal from time to time, even within the boundaries of the two great historical parties, ought to be brought home to the reader—and this especially for the sake of the reader who lives outside England. Such a criticism, however, touches the author's method, and not his fairness. He is not a partisan, though the vigor and decision with which he expresses his own judgments would hardly be within the reach of a writer whose adhesion to one party and one set of views was less definite and less unhesitating.

When we come to that greatest difficulty which is due to the fact that the events narrated are still too near to us to have fallen into their due perspective, we must admit it to be a difficulty which no skill or knowledge can overcome. It is less serious in these two volumes, treating of matters now forty years behind, than it will become when Mr. Paul brings his story down to the eighties or the nineties. Fond as he evidently is of Parliamentary struggles, he judiciously relegates questions of mere party tactics to a second place, and describes only those few debates which, by the gravity of their results or some dramatic incident, deserve to be remembered. Nothing is drearier than the wrangling or manœuvring that goes on in a legislature when one examines it after the lapse of a few years. We do not always agree with Mr. Paul's estimate of the relative importance of men or of occurrences; but only posterity can decide whether he is right or whether we are. He understands English politics as only one who has himself mixed in the life of the House of Commons can understand them, and he understands England as only an Englishman, or an American who has lived in England, can understand that singular country. It may be doubted if any Frenchman, however acute, any German, however learned and painstaking, has really grasped the spirit of English public life. Mr. Paul is thoroughly at home in it; and nothing contributes more to the force and freshness with which he writes than his own evident enjoyment of the subject. With foreign affairs, such as those of Hungary in 1849, and of Italy in 1859, he is less familiar, but these were not of prime importance to the England of those days.

In one respect historical perspective does suffer in this book. Mr. Paul, in his laudable desire to make his narrative clear and easy to follow, sticks almost too close to a chronological order. He tells occurrences as they happened, even when a grouping according to subjects would make the causal relations plainer. Ecclesiastical matters, for instance, might well be treated in one or two, or perhaps three, separate chapters, instead of being interposed among political matters with which they have seldom much direct connection. The same remark applies to the notices, always bright and pointed, of the appearance in the field of literature of striking books or notable men. Sometimes, too, a subject is introduced with an insufficient preliminary explanation. The reader is launched into the Crimean war by an admirable account of the steps by which the British ministry blundered, and were helped by the nation to blunder, into that conflict; but there is not a word to indicate the previous relations of England to the Turkish Empire—a matter which largely determined the English attitude. So it would help most Englishmen and nearly all American readers if some slight sketch of the origin and earlier phases of the so-called "Tractarian" or "Oxford" movement were prefixed to the account of the ecclesiastical controversies described in these volumes.

Accuracy is the foundation, though only the foundation, of all excellence in a history, and in this respect no serious complaint is to be made against Mr. Paul. Such errors of fact as we have noted are too few and too trivial to be worth mentioning here, with one exception. At the end of a chapter on 1847 (i., p. 156), he intimates that other anæsthetics had no employment beyond dentistry till Simpson proposed chloroform. Capital operations of the utmost delicacy were performed in America under ether, if not in Europe too, months before Simpson proposed a different vapor. But Mr. Paul is apt to be rather bold and sweeping in his statements and his judgments. For instance, to say that "Carlyle did not think" (i., p. 221), that English law in 1854 was "a barbarous system," that "the immense majority of the clergy of the Church of England were with Dr. Pusey before he died" in 1882 (ii., p. 38), that "Russia in Herat meant Russia in India" (ii., p. 65), that Cavour was "the founder of the Liberal party on the Continent" (ii., p. 193)—is to say what would be quite true and worth saying in a qualified and guarded form, but is by no means true to the extent of our author's words. Sir George Grey (Governor of the Cape and of New Zealand) was an able man, but to call him "the prince of colonial Governors" is to go far beyond what the record of his life justifies. There may be those who will think that the same tendency to overstatement appears in the literary and political judgments which Mr. Paul passes. These, however, are matters of individual taste, and are understood so to be. He is free to value Matthew Arnold's poems and Herbert Spencer's philosophy more highly than some critics do, and to think Louis Napoleon more of a mere rascal than some historians take him to have been. We are disposed to agree with these critics and historians rather than with Mr. Paul. But in these and other such cases it is well to have an author's judgment frankly and broadly stated; and there can be no doubt that the book is all the more readable because it sometimes startles, and sometimes excites dissent, even in matters where no question of political attitude arises.

Readable it unquestionably is. It is full of force and swing from the first page to the last, never flagging in the movement of the

tale. It is also perfectly clear, save that here and there we find allusions which not all British and perhaps few non-British readers will follow. Nobody but a lawyer knows the name of Meeson and Welsby's Reports; many Americans will fail to catch the point of the expression "within two hours of Folkestone" (ii., p. 288). The narrative is singularly concise, telling what has to be told in the fewest possible words. This power of compression, and the judgment with which the more important events are selected for notice out of the vast multitude of details that might have been given, constitute one of the highest merits of the book, yet a merit which might escape the hasty reader who does not know that, in the profusion of materials available to the historian of our time, lies one of his greatest perplexities. Such a power goes happily with the remarkable gift for epigram which Mr. Paul possesses, and which he abuses as little as can be expected from any one who has the good fortune to be so endowed. The narrative of the Crimean war and that of the Indian Mutiny are good instances of Mr. Paul's power of telling a story clearly and effectively. Both narratives are brief, considering the length of time they cover and the magnitude of the events. But they have none of the dryness which brevity involves in unskilful hands. The description of the battle of Balaklava is particularly well done.

These volumes cover the period during which the War of Secession raged in America, and contain a good many references to that long struggle. Though it did not directly affect the course of events in England, it excited more interest there, and gave rise to more heated discussions at every dinner-table, than did any question of contemporary English politics. Mr. Paul hardly brings out with sufficient fulness and clearness the curious phases through which English opinion passed, and which even at this distance of time Englishmen ought to understand that they may learn to estimate their own wisdom more modestly, and Americans ought to understand that they may judge the English charitably. It may be added, in passing, that Mr. Paul does not quite appreciate the technical side of the case for the Secessionists. Sympathy with those who were fighting in the interests of freedom and humanity, and also (as every one now admits) in the interests of the American Republic, need not exclude a recognition of the legal grounds on which honest and patriotic men in the South based, however unhappily for themselves, their action in trying to break up the Union.

The period we have referred to was a critical and determinative period for the United States, ushering in a new development, in which new issues and problems came to the front. For Great Britain, however, it was a time of internal tranquillity and of a movement slow and gentle compared with that which had gone on between 1829 and 1846, or that which was to go on between 1868 and 1887. The questions debated in Parliament were seldom fundamental questions. No considerable change was made in the Constitution of Britain, and only one important change in her relation to her dependencies—the bringing of India under the direct rule of the Crown. Even that was a change rather in form than in substance, less important than the granting of self-governing institutions to the British colonies in Australasia and South Africa, which proceeded quietly and unobtrusively from 1855 onwards. Whoever will compare the political arrangements of Britain now with those which prevailed in 1865, and, still more, whoever will compare British opinion as it is now with the opinion and the ideas which prevailed in the State and in the Church in that year, will be astonished at the changes which forty years have brought about. There was practically no Socialism in England in 1865. The so-called upper class, still largely the landed class, conducted the Government of the country, and were alone (with few exceptions) to be found in Parliament, while legislation was framed to suit partly their interests, partly those of the middle classes. Birth was still valued; peace and administrative economy stood highest among the national ideals. There was so little desire to extend the dominions of Britain that three relinquishments of territory—those of the Ionian Islands, of the Transvaal territory, and of the Orange River territory—passed unopposed and almost unnoticed. The progress of change began to be swift after Lord Palmerston's death in 1865 and Mr. Gladstone's subsequent succession to him in leadership, and Mr. Paul has an interesting task before him in tracing that progress down to the end of the nineteenth century.

Edward Bowen: A Memoir. By the Rev. the Hon. W. E. Bowen. Longmans, Green, & Co.

The English Public Schools are without a parallel in any other country. Their number, their wealth, the richness of their traditions, the long lists of cultivated men among their teachers, the hold which they have upon the aristocracy and upper middle class from which their pupils come, are all noteworthy. At the present time, the number of new boarding schools which have been founded in our country in open imitation of English models, and the influence and success which some of these schools have attained, render both interesting and practical the study of English Public School life. And here we have before us the memoir of a very brilliant man who with entire devotion identified himself for forty-two years with Harrow. His period of service was from 1859 to 1901. The most famous head-masters with whom he served were C. J. Vaughn and H. M. Butler. Vaughn was virtually a new creator of Harrow, which grew in his administration from 69 to 469 pupils. This fact shows us to what fluctuations of prosperity the Public Schools are exposed. Bowen came to Harrow after a brilliant career at King's College, London, and Trinity College, Cambridge. He had gained distinction as classical scholar, as English essayist, debater, athlete, and poet. He had been at Harrow only fifteen months when Vaughn resigned the headmastership to accept the post of Master of the Temple. In H. M. Butler, Harrow secured, as Vaughn's successor, a man of hardly inferior abilities. Butler had been Bowen's teacher at Trinity, and had learned, even then, to expect much of him. It is an interesting indication of the estimation in which Bowen was held, before he had long been at Harrow, that when, in 1863, B. F. Westcott resigned his assistant mastership, to Bowen was assigned the care of his house.

Bowen sympathized strongly with the demand for a modern, or English, side at Harrow, and to him was intrusted the organization and general direction of such a modern side. He held this responsibility from 1869 to 1893, and much of his writing on educational subjects was occasioned by the position which he filled. The experiment was undertaken under favorable conditions; and the determination was resolute, from the outset, that the standards of work on the English, or modern, side should be in no respect inferior to those on the classical side.

One rarely meets with stronger expressions of love and admiration than abound in this biography. Not only is the biographer, who is Mr. Bowen's nephew, an enthusiastic admirer of his uncle, but many others testify, in no qualified terms, to the personal charm, we may almost say to the spell, which he exerted upon the members of his house. Bowen was a man of genius, and what wonder that boys admired one who was at once athlete, poet, historian, man of affairs (for he once stood for Parliament in a stubborn contest against A. J. Balfour, the present head of the English Government)! That contact with him was inspiring, we cannot doubt. But he was essentially a radical, and he had marked singularities. The reader may well doubt whether he was a natural organizer, and whether he displayed that constructive talent in which great headmasters like Arnold and Vaughn have been eminent. English schools have taken so prominent a place and have gained so great an influence because they have succeeded in attracting to their service and direction men of real statesmanlike ability. Bowen was perhaps critical rather than constructive, and it is difficult to decide how important was his contribution in adapting education to the needs of modern life. Perhaps the breadth of his interests made it hard for him to devote himself with success to school organization.

Among the interesting essays which are collected at the close of the memoir, is one contributed by him in 1867 to F. W. Farrar's 'Essays on Liberal Education,' and entitled "Teaching by Means of Grammar." It is a brilliant attack on the misuse of grammar. The writer sets up as the common pleas for the prominence of the study of grammar in English schools the following considerations: (1) that grammar is useful as a means of teaching language; (2) that the study of grammar is a valuable moral discipline; (3) that the study of grammar is valuable for its own sake. He finds it easy to overthrow the positions, as he himself states them, of the advocates of grammar. The essay is of importance, not only because of its brilliancy, but also as showing how the point of view from which grammar is regarded has changed since 1867. The inference, however, that formal grammar has hardly any place in the secondary school is too sweeping. To require English schoolboys to learn their grammar in Latin, and to describe the little known by what was still more unknown, was indeed a folly which deserves any amount of ridicule. But it is not fair to deny the value of a moderate number of clear and concise statements of the facts of language, both as to syntax and as to form; or to

censure those who insist that the pupil shall both understand and remember these statements.

A splendid service which Bowen rendered Harrow remains in the long list of songs which he wrote for the school. Mr. John Farmer, the gifted school organist of that day, set most of these songs to music, sometimes within a few hours from the time when they were written. The singing of them in the Common Room of the school was a great feature of Harrow life. A vivid picture in the memoir depicts Gladstone, already in his eighties, on a visit to the ancient school, with the greatest delight joining with masters and boys in singing Bowen's songs. A friend of the writer in this country, who knows intimately the English schools, corroborates the immense value to Harrow of these songs.

Another important service was Bowen's occasional talks or lectures to the school. He lectured on astronomy; and he had a series of talks on modern battlefields of Europe, which are described as most interesting. He had personally explored these fields, and his talks were illustrated by maps of his own preparation.

Bowen shared the English gentleman's passion for athletics. Among his feats was that of walking from Cambridge to Oxford in twenty-six consecutive hours. He refused to recognize the limitations of age, but played football with nearly the same spirit and force at sixty as at thirty. The end of his life came from heart failure, while on a bicycle tour in France during the Easter holidays of 1901. He was with his intimate friends, Mr. James Bryce and Mrs. Bryce. They had just walked up a rather long hill, and he was putting his foot on the bicycle step to continue the journey when, like a flash, the end came.

Our American schools organized on English models have failed to parallel one important feature of their prototypes, viz., to secure a considerable number of cultivated and able men who cooperate with the head master in giving character to the school and in guiding the development of the boys. With us, there is a tendency to think of the school as depending mainly upon the personality of the head master. No doubt, a certain autocratic character is essential in administration, here as there. But it is very desirable that eminent gifts of scholarship and character should abound in assistant masters. Only then can the intellectual activity of the school, which is always in danger of stagnation, be sustained. Then only can the life of the school possess the breadth and variety which are essential in a place where boys are expected to spend from six to nine years. Then only can the permanent existence of the school be assured. In England, the sub-master derives from the fees which come from the boys of his house a comparatively liberal income. This income tempts and induces many men of first-rate ability to accept these places as their life-calling. Our schools which most nearly reproduce English public schools have not, as a rule, thought it best to reproduce the numerous houses, each presided over by an assistant master with considerable independent responsibility and corresponding pecuniary gain. How, then, shall the men of high gifts be secured? Salaries must apparently be raised, and every possible means must be employed to render these places attractive. Upon securing and retaining, in each large boarding school, a considerable number of men distinguished for character, scholarship, and personal attractiveness, the future of our schools depends.

The Neighbor: The Natural History of Human Contacts. By N. S. Shaler. Boston: Houghton, Mifflin & Co. 1904.

There is a fascination in these observations concerning matters and things in general which Professor Shaler is now publishing; a fascination not easy to explain. Many of his sayings suggest Holmes's lines on the Katydid. Propositions that are axiomatic with schoolboys are advanced in as solemn a way as if they were important discoveries, and not a ray of humor enlivens the all-pervading seriousness. On the other hand, propositions explosive as bombshells are tossed out with no intimation that any one has ever controverted them, or that it would make any difference if any one ever had. Most of his conclusions, Professor Shaler informs us, are derived from his personal observations, and he takes it for granted that no further proof is necessary. When he has not been able to observe, he has asked his friends to favor him with their impressions, and their testimony is accepted as decisive. From some points of view results so obtained are satisfactory; yet the process savors a little too much of infallibility. Authority is a convenient refuge, but science is not content with it.

Take, for instance, the assertion that it is at present better for the American negro not to acquire the ownership of land, but to hold it as a tenant under a white landlord. Many books have been written concerning the diverse forms of land tenure, and the advantages and disadvantages of peasant proprietorship have been the subject of much controversy. Professor Shaler settles the matter in five lines. Comparing the métayer system of northern Italy with the system of proprietorship generally prevailing in France, he remarks: "From personal observation of these tenant farmers in Tuscany, I am satisfied that the method is on the whole better for them and for the land than the French system, where the laborer owns the ground he tills." On so intricate a subject as this, with numberless causes at work for ages, the personal observation of even a very intelligent man cannot be accepted as conclusive.

Why do we continue to read an author whose statements frequently amaze and exasperate us? Partly because of the reasoned benevolence which pervades all his opinions and recommendations. His desire to promote kindly relations between all men, of whatever race or color, is constantly manifest, and it is impossible not to be moved by it. There is withal a certain pleasure in having pointed out to us the traits which we derive from our simian ancestors, and the similarity between our instincts and those of animals in general. Do we start at the sudden sight of some uncouth fellow-creature? So does a horse start at an automobile. Everything to which we are unused is at first alarming; this is the law throughout the animal world. During his prolonged continuance in the tribal state, man learned to dread and to hate whatever was outside of his little circle. Every stranger was an enemy, and even the most civilized men feel at first sight an instinctive aversion to a foreigner. At best we are on our guard; we are suspicious of this outlandish man, who may, for all we know, mean to do us harm. To have these mysterious impulses traced to their remote sources, to learn how our emotions have been developed out of those which we observe in the lower animals, and to be taught how pestilent the emotion of hatred has become in the modern world—all this is grateful to the ordinary reader. He feels that he is a part of "one stupendous whole," that, as a man, nothing human is alien to him.

The particular task undertaken in this book is to explain the antipathy of people of Aryan stock to Jews and negroes. As to the Jews, Professor Shaler finds that they are clearly the ablest folk the world has ever known. They are "of abiding moral quality"; they are very humane. "When we meet our neighbor in a Jew, the chance is that he is an able, trustworthy man." There is nothing in the physical aspect of Jews to account for our instinctive dislike; their countenances are more prevailingly intellectual, and kindlier, than our own, The only discoverable ground for our antipathy, apart from the survival of tribe hatred, is the existence of too much responsiveness to our advances, and a disposition to seek immediate profit on unsuitable occasions. This does not appear to be a very satisfactory explanation of the phenomena, but perhaps it is the best now attainable.

The study of our relations with the negroes is much more thorough. Here the physical differences are enough to bring out racial antipathy; but "the instinctive dislike to the negro disappears much more quickly than the prejudice against other races less remote in quality of body from ourselves." The author declares that he has never known an instance in which it persisted, provided the contacts were intimate. The negroes are affectionate and faithful; they have a disposition which is perhaps more cheerful, more kindly, than that of any other race. They were uplifted from their benighted state in Africa by slavery; their enslavement here christianized them; "they were cared for by their masters, especially by the women, with an admirable devotion for their moral welfare." So far as morals in general are concerned, Professor Shaler holds the negroes to be equal to whites of like station.

The explanation of our hatred of the negro appears to be found in his political incapacity. Professor Shaler is satisfied that he is by nature incapable, as a species, of creating or maintaining societies of an order above barbarism; and this incapacity is irremediable. It existed in Africa, it has been displayed in Hayti, and it appeared in the days when the carpet-baggers ruled the South. Nevertheless, Professor Shaler thinks a considerable part of the black people will be found very well fitted for the more serious duties of citizenship. Not more than 5 per cent are hopelessly savage.

There is a good deal of the old "cursed be Canaan" twang to this, and we do not need to say that Professor Shaler's assertions will be disputed. Be this as it may, we must commend the manner in which he calls knowledge to the aid of righteous-

ness, and shows how reason may triumph over the "primal impulses." Even if we study our fellow-creatures from scientific curiosity, we find our sympathies aroused, and learn to admire what at first repelled us. The science of mankind thus attains a wider meaning. "Whoever would act rationally in his dealings with his fellows, whoever would bring into those relations the best help that knowledge can give, must first of all take with him love. If he does that he is in the way of light; if he fails so to do, he is in the way of darkness."

Problems and Persons. By Wilfrid Philip Ward, author of 'William George Ward and the Oxford Movement,' etc., etc. Longmans, Green & Co. 1903.

Mr. Ward has brought together in this volume eleven articles, three of which have not until now been published under his own name; one other is entirely new, namely, the "The Life-Work of Cardinal Wiseman." It is the least important of the series for those who have read Mr. Ward's 'Life and Times of Cardinal Wiseman,' being a presentation in brief of the main contentions of that book, so favorable to Cardinal Wiseman's relations to the modern spirit and English secularity in comparison with Cardinal Manning's. But Mr. Ward's judgments of Cardinal Manning are without severity. Indeed, one of these articles, the fifth, "Candor in Biography," is an appeal from the harshness of the Purcell biography of Manning, not so much impugning its accuracy in particulars, as questioning the proportions of its praise and blame. The article is well worth considering, especially as showing the almost inevitable tendency of the reviewer of such a book as Purcell's to overemphasize the adverse particulars, and so create in the community a worse impression than that made by the book. But the demurrer which this article puts in, leaves Mr. Ward strongly in favor of the Newman, as against the Manning, tradition of English Catholicism; the entire structure of his opinion as to the present and future standing of Roman Catholicism being founded on the ideas of Newman presented in his 'Development of Christian Doctrine,' the book which he wrote as an Anglican and published as a Roman Catholic—the bridge by which he made his intellectual passage from the one church to the other.

The articles included in this volume have at least three degrees of popular interest, if we should not say one degree of popular interest and two removed from this. The general reader will be most drawn to the articles on Tennyson and Huxley; next to the other personal articles on Mrs. Augustus Craven, Cardinal Wiseman, and Newman and Renan, who are bracketed in the ninth article. The remaining articles appeal to a much narrower circle of readers, yet, coming to their own, they will appear, and justly, to be of much more importance than the rest, and will have a corresponding fascination. The value of the article on Tennyson resides mainly in its character as a record of first-hand impressions made upon a mind exceptionally impressional and intelligent. We have had reminiscences of Tennyson before now remarkable for their triviality—those of Mr. G. W. Smalley, for example, far less significant of Tennyson than of the interloping interviewer. Doubtless there was food for laughter in some of the situations created by obsequious admiration; Sir Leslie Stephen confessed as much in one of his later articles. But in Mr. Ward's "Tennyson" we have an approach at once reverent and critical, with some valuable corrections of things generally misconceived. The emphasis is on the laureate's "intense candor and truthfulness." He had to a preëminent degree that humility and sensitiveness which Bacon described as indispensable to the student of nature. Equally to the poet, Tennyson would have said. A certain literal truthfulness and scrupulosity was an amusing trait. He would spoil a good story by repeated interruptions reminding the speaker of the exact particulars of what he conceived to be its proper form. Having written "two-and-thirty years ago" in a poem, and afterward discovered that only thirty-one years had elapsed, he could hardly be persuaded to refrain from changing the line. The extent of his knowledge will be a surprise to many readers. Macaulay's ability to name the Lord Chancellors in their order of succession pales in the light of Tennyson's acquaintance with the Buddhist sects and the dates and circumstances of their origin. Could he also venture on the list of Popes without fear of being slaughtered by the Leos or among the Innocents? His knowledge of stellar and planetary distances and movements was extremely accurate. His "Vastness" reported his habitual sense of the world's awful magnitudes. There were ideal anticipations of evolutionary principles in "In Memoriam" that made Darwin's doctrine of the descent of man attractive to him as explaining man's dual nature.

Even more interesting than the article on Tennyson is that on Huxley. Many sturdy Protestants would hardly conceive it possible that a Roman Catholic could write of such a heretic as Huxley with so much sympathy and admiration. This article certainly is less Roman than catholic. its main direction being towards the opinion that Huxley was fundamentally serious and reverent in his attitude towards religious questions, and more religious than unbelieving in his inmost mind. Particularly noticeable is his just indignation excited by Balfour's 'Foundations of Belief.' "Balfour," he said, "has gone to war without ordnance maps, like the French in 1870. He does not know the position of his enemy, and attacks me for what I don't hold. No one holds what Balfour describes as 'Naturalism.'" An ecclesiastical friend met him in York minster: "You did not expect to see me here?" said Huxley. "Yes," said his friend, "but on the pinnacle." He enjoyed the joke, as he did always a retort of this kind and any perfectly frank opposition; as when Mr. Ward's father told him at the Metaphysical Society that his degree of error was unpardonable from the Roman Catholic point of view. "My dear Dr. Ward," said Huxley, "if you don't mind, I don't." Huxley's liking for Dean Stanley was immense, but he thought him a victim of "the topographical fallacy." To see a place was for him to believe what was told as happening there. He had been in Palestine, and hence believed the patriarchal legends to be true; but he did not accept the cosmology of Genesis, because he was not present at the creation of the world. The article on Newman and Renan calls attention to the almost exact coincidence of Newman's becoming a Roman priest and Renan's ceasing to be one for ever. The two events were only two days apart—Newman's submission, October 8, 1845; Renan's rejection October 6. Mr. Ward's treatment of Renan is characterized by a remarkable geniality, but he comes round to the conclusion that Renan found Roman Catholicism impossible because he was not a Christian.

This article, with four others, "The Time Spirit of the Nineteenth Century," "The Rigidity of Rome," "Unchanging Dogma and Changeful Man," and Balfour's "Foundations of Belief," are so many phases of a line of argument which is Mr. Ward's personal contribution to the problem of the position of Roman Catholicism in the modern world. The old idea of fixity is parted with, while the claim is made that "there are central religious ideas reappearing in a more and more purified form under the influence of exacter knowledge and of the criticisms of the intellect and moral sense." Here is a method which in course of time might make the theology of Rome that of Phillips Brooks or Dr. Channing or more radical thinkers. Mr. Ward's first and longest article takes a wide sweep and abounds in brilliant generalizations. He accepts the idea of evolution as "the new framework" of thought, and expects from it something of that composure and dignity which formerly proceeded from the unity of Christendom as embodied in the Roman Church. The results of modern Biblical criticism are accepted quite as cordially as the principle of evolution. There is room for doubt whether William George Ward, "Ideal Ward," the present writer's father, who egged Newman on to the dangerous positions of "Tract 90," would be quite happy if he should revisit the scene of his intellectual vicissitudes and find his son writing in this manner.

Greek Votive Offerings. By William Henry Denham Rouse, A.M. Cambridge (Eng.) University Press; New York: Macmillan.

This is a work—almost a pioneer in its branch—of great research and erudition, presenting an enormous mass of facts, with all the completeness attainable considering that the facts are constantly accumulating. The arrangement of such a mass of material presents, naturally, great difficulty, especially since it is not easy to discover any stable principles of classification, and since the theories which have been hitherto assumed have vanished as the author tried to collect evidence for them. If his research leads to any general conclusion, it is to a "conviction of the sincerity and simplicity of Greek religion in the great age, and the elements of corruption which finally brought it to naught." By the last statement he means that about the fourth century B. C. the votive offering begins to lose its sincerity, and is given as a "means of self-glorification," as a memorial of the donor's virtues or exploits. A fixed date in such matters must, obviously, be taken with many allowances. The motive of many a donor in earlier times may have been mixed and selfish, and in later times may have continued pure. In the case of votive offerings for re-

covery from sickness or escape from peril and accident the author recognizes this fact; and the chapter which he devotes to this subject is a most striking illustration of the absolute permanence of motive and custom in this superstition, and of the identity of its manifestation in ancient and modern times. Not merely do the official miracles of the temple of Æsculapius at Epidaurus resemble those of Our Lady of Lourdes, but the small local chapels in Greece which continue to work marvels of healing and saving in the present day are in some instances the direct heirs of local shrines which have persisted on the same spot since the classic period. They contain the very same heterogeneous collection of boats, cradles, legs, arms, hearts, and eyes which are reported in the inventories of ancient shrines. The chattering pair of women whom Herodas describes as surveying the curiosities of the temple of Æsculapius at Cos would be very much at home in the sanctuary of the Virgin at Tenos, or at Ayassos in Lesbos, though they would doubtless be puzzled by the model of a paddle-steamer or of a manufactory with a smoking chimney.

When Mr. Rouse fixes the beginning of memorial dedication in the ninth or tenth century, this again is a date which must not be pressed. He bases his inference on the evidence of Homer and Hesiod. In Homer the practice seems to be beginning, and the technical term for a votive offering not to be quite fixed; in Hesiod the formula is fully recognized. Homer is a slippery witness, for he holds his tongue, for reasons of his own, about a good many things which he knew perfectly well. Statues, for instance, as M. Bréal reminds us, he does not expressly mention, yet the Argive Heræum was full of idols going back to the Mycenæan period and centuries earlier. This only illustrates the difficulty of attaining any precision in summarizing Mr. Rouse's subject. The Greeks had priests, but no dogma, practically, and no official theology. In the matter of votive offerings, "any one might offer anything under the sun," and to any deity; the golden tithe of Crœsus, the peasant's handful of corn, the fisherman's net, the schoolmaster's taws, and, we regret to say, the mirror of Lais, were equally acceptable. The taws may be an inventive fancy of the witty epigrammatist: the mirror was doubtless an offence in the eyes of many respectable Greeks, as it is in ours; with us, too, ill-gotten gains creep into the service of the sanctuary. But an examination of the immense range of heterogeneous offerings, with their inscriptions and dedications, will reveal in the earlier period genuine piety and thankfulness, a sweet and charming naïveté, not unmingled with a canny spirit which expects a good bargain and a fair exchange from the deity addressed. That, indeed, shows itself unreservedly in the prayers of the Homeric heroes.

An ugly side of the votive offering was the practice of cursing or anathematizing one's enemy in formulas as "detailed and elaborate as that of the jackdaw of Rheims." and that, too, in cold blood, without the excuse of passion, or enmity, or revenge. The boxer prays that his rival may lose his strength; the litigant, that his adversary's tongue may be as cold as the lead he writes on. These are generally engraved on leaden sheets and buried in the earth, and are sometimes combined with a relief. The practice and the formulæ persisted in the island of Calymnus in 1798, and has probably not disappeared in the present day. "Binding Spells" are still the terror of the Greek bridegroom. A much pleasanter application of the same logic was the custom of manumitting a slave by the fiction of dedicating him to a divinity. A large number of inscriptions recording this act were disinterred in the recent excavations at Delphi.

It is easy to judge how valuable for the purpose of the specialist and of the student of life and manners is the body of Mr. Rouse's collections. To this rich storehouse, with its labyrinthine windings, it can hardly be said that the author has provided the key and the clue. But the final chapter which summarizes his research is highly interesting, and presents some useful conclusions. Symbolism in dedication he denies almost *in toto*. The owl of Athens had much the same significance as the Russian bear in a cartoon of *Punch*. The tripod, the lyre, the thyrsus, the trident, the cuckoo, the snake, the dove, were never worshipped as standing for Apollo, Dionysus, Poseidon, and the rest. Fetishism, of course, he admits; but the objects and animals just mentioned, he maintains, are associated with particular deities as "part of their character costume." As *offerings*, on the other hand, they are not confined to special deities; they are given on their merits for the same reasons as offerings in general. A lyre is found dedicated to Athene, but none to Apollo. An inspection of the exhaustive lists of articles dedicated to the various divinities will show that they are all equally miscellaneous and equally destitute of special significance. Mr. Rouse does not concede the symbolic, or hieratic, meaning which Mr. Evans assumes for the double-axe found in such hosts in the Cretan excavations. There is nothing holy about this kind of axe (or about the tripod). If Zeus of Labranda carries one, it is a weapon, and in his capacity of protector of the city. Axes, tripods, bars of iron, shields, and other objects had anciently a fixed value, and passed current like coins; they were used as prizes in the Iliad and Odyssey. The vast number of miniature axes found in the Dictæan Cave he regards either as coins, meant to be strung like Chinese *cash*, or as tokens, halfway between the implement and the coin; the same explanation would apply to the minute kettles and tripods of Olympia, and to multitudes of miniature rings, lances, shields, and chariot-wheels discovered in the most diverse shrines. They were tokens used in exchange, and paralleled by the ancient coinage of China.

This work is provided with elaborate indexes, and with lists of a dozen temple treasures derived from the inscriptions. If the reader misses anything, it is, as we have said, some illuminating principles and generalizations. But Mr. Rouse has cleared the way, he has amassed the facts with praiseworthy industry, and has provided for others the means to classify and theorize and introduce luminous order, if possible, into a labyrinthine subject. Mr. Rouse spells his preterites *markt, lookt, worshipt*, etc. But this whimsy will do no harm, for few are likely to imitate him, and a hard-worked scholar has the right to cut a few capers by way of diversion.

Rossetti. By Arthur C. Benson. (English Men of Letters.) The Macmillan Co. 1904.

This is by far the most intelligible biography of that interesting personality we have yet had. In compiling it Mr. Benson had quite an extraordinary amount of documents to deal with, what with the industrious zeal of W. M. Rossetti in publishing family letters and diaries, as well as his Life of his brother in two volumes, which left the reader with a very disagreeable impression of D. G. Rossetti's personality; the innumerable magazine articles written by various people who had known the artist and some by those who had not, and the frequent mention of him in memoirs and autobiographies of his contemporaries. From all these various sources, both friendly and inimical, Mr. Benson has put together all that is characteristic; and although the narrative of that singularly tragic career is contained in seventy pages, it gives all that is of any importance, and describes the poet-painter as he seemed to those who knew him well. Mr. Benson had the advantage also of the help and criticism of Rossetti's friends, Fairfax Murray, Watts-Dunton, Hall Caine, and others, as well as of Mr. W. M. Rossetti; to these he acknowledges his indebtedness in the preface. It is evident that no pains were spared to arrive at a just and truthful estimate of Rossetti's character and life, his aims in painting and poetry, his views on literature, and his general attitude of mind—no easy task with so much conflicting evidence; but our author has succeeded in producing a very vivid image, which makes the influence of this great artist over his contemporaries better understood than is possible from other books about him. Innumerable fantastic legends have been circulated about Rossetti which had their origin in the peculiar circumstances of his life and his aversion to publicity, in refusing either to exhibit his pictures or to admit outsiders to see them. The greater number of those who were so privileged fell under the spell of the artist himself and of his work, and their report excited public curiosity to a very high pitch and gave rise to exaggerated stories, which continued to increase as years went on and the seclusion of Rossetti's declining years became more complete, while he fell a prey to insomnia and its consequences.

Rossetti's extraordinary influence over all who approached him was of an almost unparalleled order. His natural imperiousness was that of one used to command, and few felt inclined to dispute his authority. When one considers the men over whom he exercised for a time this personal magnetism—men of such marked individuality as Madox Brown, William Morris, Ruskin, Burne-Jones, Swinburne, George Meredith—the point is still more striking. His connection with Holman Hunt and Millais in forming the Pre-Raphaelite Brotherhood was of short duration, and his relations with them were not of such reciprocal friendliness as with his later friends. The trait in his character which must have appealed to all artists was his extreme appreciation of the work of others when it had any of the qualities he prized in art, his readiness to give counsel and direction, and his generous manner of according encouragement

and advice when it was sought for. Up to the very last he had enthusiastic devotees, who considered it a privilege to share his solitude and minister to his wants. It seems all the more tragic that a man so nobly gifted with so much power in expressing his individuality, in the arts both of painting and of poetry, should, through want of self-restraint, have been unable to face the exigencies of life more successfully.

Mr. Benson's appreciation of Rossetti is chiefly as a poet; throughout the volume he treats at length of the verse, although he tells also of the pictures and their subjects, in due order. He asserts that Rossetti had no affinity for either of the two strains which have chiefly predominated in England in the nineteenth century, "the impulse to annex philosophical speculation to poetry to find a poetical solution for the problem lying behind nature and life, or to turn to account emotions of a philosophic kind. The other notable element has been the poetry of passion, of human relations and affections in their most direct forms." While Rossetti belonged to the mediæval school of Italian poetry, and cared as little for national problems as for abstract thought, to quote our author—

"To him the emotions and the experience of life lay entirely in the intricate and complex development of human passion, the mysterious relations of human spirits; but even here he did not approach the thought from the abstract side. For him human passion was inextricably connected with its outward manifestations, in the emotions stirred by the apprehension of beauty alike definite and indefinite, the gracious mysteries of which human form and features, gesture, movement, and glance, seem a sacramental expression. This was not in Rossetti's case a purely material sentiment; all these lovelinesses seemed to him to hide a secret, to be the very voice of some remote spirit speaking instantly to the soul."

He had set before himself as the task of his life, *the embodiment of mystical passion.* It was in this limitation and his sense of the dramatic moment that his especial power consisted, and, according to our author, Rossetti's position with regard to the literature of the century is lonely and esoteric, his influence in poetry extending only to poets of a secondary order who care for form rather than matter. Benson, however, attributes to D. G. Rossetti, Christina Rossetti, and Swinburne a reformation in the language in the use of simple and direct words. Tennyson had, in the "Idylls of the King" and later work, fallen from the freshness and charm of the language of his earlier work into conventional expression, and to Rossetti is due the new impulse towards simplicity of expression in English poetry. Mr. Benson considers that to Rossetti's Italian temperament is traceable the want of observance of accepted conventionalities in treating of love in his "House of Life." It is rather surprising that at this moment any critic having any pretensions to width of outlook should find any fault as to want of reticence in these sonnets, since the most popular novels of the day contain passages on sexual relations, crudely expressed, which do not in any way deter "the young person" from reading them. The world has made some progress in disregarding many old established prejudices, and the artistic temperament is not the sealed book it used to be.

Notwithstanding occasional lapses into fine writing and a superfluity of analysis, those who wish to know more about Rossetti, his life and ways, will do well to read this volume.

BOOKS OF THE WEEK.

The Times Saturday Review
says of
The Transgression of Andrew Vane
By GUY WETMORE CARRYL, $1.50
"It is a strong and original story . . . the descriptions of conditions in the American colony are convincingly clever. The story from the prologue—one of exceptional promise in point of interest—to the climax reached in the last page but one is full of action and dramatic surprise, and the character drawing is generally good."

NEW BOOKS SCRIBNERS

Of THE AMERICAN NATURAL HISTORY

The New York Sun says: "A great natural history. . . . An ideal animal book. . . . Common sense is the author's marked characteristic. Nothing healthier can be imagined for those who have been wading through the artistic sentimental slop that passes for Natural History."

The Brooklyn Eagle says: "It is a work of dignity and importance, of large size, profusely illustrated and written with intent to appeal to the average reader who is interested in animals."

The Dial says: "It would seem that every effort has been made by the author to secure accuracy and modernity of treatment, and his book is altogether one to be prized on every account."

The Outlook says: "Mr. Hornaday is a practical man and he has written a practical book. . . . thoroughly dependable as regards facts and scientific in spirit, yet written with liveliness and freshness of manner."

The Rochester Democrat says: "It is a veritable treasure house of animal, bird and fish lore, and must become a standard work with educators and students as well as with the general public."

By W. T. Hornaday, Director of the New York Zöological Park. In an 8vo volume, double column page, profusely illustrated. $3.50 *net* (carriage extra).

THE NEW FICTION

By THOMAS NELSON PAGE

"He belongs to the old Virginia quality; he knows the life of the people, he knows the negro and renders his dialect perfectly; he has an eye for the picturesque, the poetic and the humorous, and his style shows exquisite taste and skill."—Nashville American.

BRED IN THE BONE

Illustrated, 12mo, $1.50

The stories in this book have all the distinguished qualities which have made the great repute and popularity of the author of "Marse Chan" and "The Old Gentleman of the Black Stock." The book represents the maturity of Mr. Page's talent as a story teller.

Educational.

CLARK UNIVERSITY
Worcester, Mass.
Offers courses in the following departments:
Mathematics **Biology** **Anthropology**
Physics **Psychology** **Education**
Graduate students only.
Unexcelled laboratory facilities.
Special preparation for the degree of Ph.D.
A new Library, richly endowed and already well equipped in the above departments, and with everything accessible to all, has just been opened. Its resources and its methods of coöperating with other leading libraries a specialty.
Five journals connected with the departments, including
A new journal of Religious Psychology
Also new lecture courses and a new library department just founded in this field.
Fellowships and Scholarships in each department awarded early in June.
For further information, register or details of Fellowships, address
CLARK UNIVERSITY, Worcester, Mass.

HARVARD UNIVERSITY
THE LAWRENCE SCIENTIFIC SCHOOL
offers four year courses of study leading to the degree of S.B. in Civil, Mechanical, and Electrical Engineering, Mining and Metallurgy, Architecture, Landscape Architecture, Forestry, Chemistry, Geology, Biology, Anatomy and Hygiene (preparation for medical schools), Science for Teachers, and a course in General Science. Students are admitted to regular standing by examination and by transfer from other Schools or Colleges. Approved Special Students may be admitted without examination. The Catalogue will be sent on application to the *Secretary*, J. L. LOVE, 16 University Hall, Cambridge, Mass.
N. S. SHALER, *Dean.*

DIVINITY SCHOOL
—OF—
HARVARD UNIVERSITY
CAMBRIDGE, MASS.
AN UNDENOMINATIONAL SCHOOL OF THEOLOGY
Announcement for 1904-05, Now Ready.

The Browne and Nichols School
Cambridge, Mass. For Boys. 22d year. Course 8 years. Classes limited to 15. Pupils continuously under supervision of head teacher in each department. **Exceptional facilities for fitting for Harvard.** Illustrated catalogue.

PRINCIPAL SOMES'S SCHOOL
Aurora-on-Cayuga-Lake, N. Y.
A Home School for Thirty Boys. Superior preparation for college work. *Personal instruction.* Ideal location for outdoor life. Yearly charge $500.

Willard School for American Girls.
Berlin, Germany.
For circular, address Dr. ALICE H. LUCE, Oberlin, Ohio.

Teachers, etc.

A HARVARD JUNIOR DESIRES to take charge of boy or boys for the summer, to travel abroad, or at camp or cottage. Has musical and athletic training. Good references. Address
J. L. W., Grays 28, Cambridge, Mass.

AN EXPERIENCED CLASSICAL Teacher, very successful in college preparation, will spend summer on Maine coast near Portland, and tutor one boy in classics and other studies.
Address Dr. D., care *Nation.*

YOUNG LADY DESIRES POSITION as companion. Musical; glad to travel; best of references. Address M. K. W., care *Nation.*

JOHNSON'S FORMS OF ENGLISH POETRY

By CHARLES F. JOHNSON, L.H.D., Professor of English Literature in Trinity College, Hartford, author of "Elements of Literary Criticism," etc.

Price, $1.00

EQUALLY suitable for young people and for general readers, this volume contains the essential principles of the construction of English verse, and its main divisions, both by forms and by subject matter. The historical development of eight of these divisions is sketched and briefly illustrated by examples, but the true character of poetry as an art and as a social force is always kept in evidence. The book will cultivate an appreciation and a love of poetic literature, and will arouse in the student a love of poetry that is too often absent from the routine analysis of literary masterpieces undertaken to fulfill the requirements of admission to college.

AMERICAN BOOK COMPANY
100 Washington Square, New York City

Mrs. PIPER and the SOCIETY for PSYCHICAL RESEARCH

Translated from the French of M. Sage. With Introduction by SIR OLIVER LODGE.

12mo. Price, $1.00 net

A sane and interesting narrative of phenomena that must appeal to all thoughtful readers.

SCOTT-THAW CO. 542 Fifth Avenue, N. Y.

The Nation.

NEW YORK, THURSDAY, JUNE 2, 1904.

The Week.

There is certainly a comic element in the latest descent of Republican Senators upon the White House. They have gone, unless their own discreet leakings bewray them, to remonstrate with the President for taking everything into his own hands. Aldrich and Kean and Fairbanks and the others are pained to find the campaign cut and dried—not by their own hands. Here is Mr. Cortelyou announced as National Chairman, though the Convention is still three weeks away and the National Committee has not even met, to say nothing of organizing. Platform and the nominating speeches have received the White House *visé*. It is more than hinted, besides, that the President is going into the paddock to pick out his own running mate. All this, protest the grieved Senators, tends to degrade the National Convention very much to the condition of the sturdy beggar who told the magistrate that he "did some work fifteen years ago." Yet why should the Senators be filled with dismay at seeing the President display the qualities for which they have praised him? Have they not written countless platforms and made endless speeches in laudation of his fearless energy, his powerful grasp of public affairs, his bold initiative, his inflexible resolution in getting the thing done? Really, the one who is entitled to be surprised is, not they, but Mr. Roosevelt himself. He might reasonably say that he was but acting in the very way that they liked and applauded. His ready audacity, his habit of going straight to his goal, his contempt for precedents and appearances—why should they shout themselves hoarse over his masterful fashion of doing the work next at hand if they really objected to it?

The complex politics of this country never produced a stranger set of contradictions than are presented by the Wisconsin fight. Senator Spooner, who has identified himself so prominently with the expounding of Administration policies that it is hard to see how any gathering of Republicans can get along without him, will go to the National Convention at the head of a bolting delegation, while the regular credentials are held by the followers of a man as far removed in his political ideals from the school of Aldrich, Allison, Payne, or Dalzell, as is John Sharp Williams. Considerations of mere consistency strongly favor keeping out of this year's convention the Republican apostle of "running amuck." The irregulars in State politics are strictly orthodox on national issues. The report that if the "Stalwart" delegates are seated at Chicago, the La Follette men will "take it out" on the national ticket, has thus a strong basis of probability. Publication of extracts from the minutes of the State Central Committee appear to show beyond dispute that even if the Stalwarts' position as to the rights of delegates had been sustained, La Follette would still have controlled the convention. The committee voted unanimously, on motion of one of the six "Stalwart" members, to seat two of his county delegations, which, together with the votes already conceded, made a clear majority. On the question of party loyalty there appears to be little choice between a faction which would elect a Democratic governor rather than give in, and one which is ready to give the State's electoral vote to the Democrats if it fails to gain its point.

A verdict acquitting Barrett and Tyner, accused of procuring and extending official favor to get-rich-quick swindles, surprises nobody who has watched the course of the trial. There has evidently been much sympathy for Tyner, an old man, broken in mind and body; and, more than that, the evidence has admitted the doubt whether he may not have been "worked" by his nephew, Barrett, in whom he may have confided. In short, the jury, even if "morally certain" of Tyner's and Barrett's guilt, may yet have felt that absolute legal proof was lacking. But were Tyner absolutely innocent, he nevertheless richly deserved dismissal from the Postal Department; on the most favorable construction of his acts, he was grossly incompetent. True, the President, in dealing with Cornelius Van Cott of New York, proceeds on the theory that a postmaster, however incapable or corrupt, may serve out his term so long as he is not unmistakably a criminal. But the Van Cott case was an exception to the rule which the President has laid down for other men; for Van Cott has the backing of powerful politicians, for whose favor just now the President seems ready to sacrifice his principles.

If the campaign against quack doctors, fought with the fraud order as a weapon, is to begin directly, one safe prediction is that next year's deficiency bill will carry a substantial item for additional assistants in the offices of the chief postal inspector and the assistant attorney-general for the Post-Office Department. The cause is good, but the result of a systematic overhauling of the worthless patent medicines and the advertising charlatans will be like stirring up a nest of wasps. Even when the Government has a clear case, the men who are hit will not succumb without a legal fight, while in the majority of cases, where there will doubtless be something plausible to say on the other side, the undertaking will be still more difficult. A great army of rural weeklies will protest that they could not live without the questionable advertising which they get on long-time contracts with sure pay. It is a reproach to a section of the religious press that it, too, has been willing to open its columns to the offensive announcements. These will denounce as harsh and tyrannical the action which excludes them from the mails. It remains to be seen, in any event, how far the house-to-house circular or the card handed out on the elevated stairway can take the place of newspaper exploitation of "osmotic treatments."

It looks as if the Merchant Marine Commission might prove a kicking gun for the Republicans. It was one thing for such men as James J. Hill and Lewis Nixon to cast contempt on ship subsidies, but it is quite another for Edwin S. Cramp to say that he has thrown that policy overboard. In his remarks before the Commission at Philadelphia on Friday, he said a number of things which should not be told in Gath. There was a time, he declared, when materials entering into ships were lower in this country than in Europe, and that time was only six or seven years ago. The fact that we can produce materials as cheaply as our competitors, whenever we see fit, is not a very good argument for bounty-fed ships. Mr. Cramp sees that the game is up, so far as subsidies are concerned. As he cannot get what he would like, he will take what he can get. At least, he cries, give us larger postal grants and discriminating duties. Do the shipping mendicants know what they are doing in asking for discriminating duties? Are they prepared to throw over all our treaties with foreign Powers and provoke retaliatory measures? Such a policy as Mr. Cramp suggests is explicitly forbidden. Our treaty with Great Britain, for instance, provides that British goods shall be subjected to no higher duties than are levied on similar goods "on the importation of the same in American vessels."

Wool statistics, as given in the annual report of the New York Chamber of Commerce, should draw forth a word of explanation from Secretary Wilson. The Department of Agriculture states that the number of sheep in the country increased from 41,883,065 in 1899 to 63,964,876 in 1903. But the Chamber of Com-

merce reports only 39,284,000 sheep last year. The trustworthiness of the Government's statistics can hardly be admitted, even assuming that lambs were omitted in 1899 and included in 1903. The Chamber of Commerce's enumeration, which conforms closely to that of other experts, fails to show that the Dingley tariff has stimulated the sheep industry to any remarkable extent. In fact, there are not nearly so many sheep in the country to-day as at some previous periods. In 1893 we produced 303,153,000 pounds of wool, but in 1903 the clip amounted to only 287,450,000 pounds. All this may seem strange, in view of the apparent high prices the growers have been getting for their wool for the last few years. As for the wool manufacturers, their profits are coming hard this year. By a striking coincidence, just as the Chamber of Commerce announces that the duty on carpet wool "discourages our manufacturers," word comes that the Bigelow mills at Lowell will shut down for over a month, throwing 3,500 operatives out of work.

Ex-President Cleveland goes too far in saying that the gold reserve in the Treasury still lacks such safeguards as would have prevented its depletion in 1894. There is a measure of truth in this, but the conditions of 1894 are not likely to recur. The chief trouble ten years ago was that the Government was spending more than it collected. Then it became necessary to issue bonds. If Uncle Sam had said squarely to the world, "For every dollar of money you lend me, I promise to return a dollar of gold of standard weight and fineness," he would have had no such trouble as he then experienced. The Treasury may have to borrow again, some day, but when this occurs Wall and Lombard Streets will not have an ague fit, as they did a decade ago. The financial world will say that Uncle Sam is hard up, and that it will be no sin to stick him for the highest rate he can be made to stand; but it will not say that the purchasing price of the dollar is likely to be cut in half. Thus the gold-standard law of 1900 makes 1904 a very different time from 1894.

That even the pro-American Federalist party in the Philippines is interested in the subject of independence may be learned from its organ, *La Democracia*, Manila. In the issue of March 30 that journal sums up recent American discussion of insular problems, attaching peculiar importance to Secretary Root's speech before the Union League Club. "Of more importance than the foregoing report [Gov. Taft's] is, in our modest opinion, the address given recently by ex-Secretary Root, . . . an address received with unconcealed apprehension and disfavor by an American journal of this capital, which calls the ex-Secretary a 'twaddler.'" The expression which especially aroused the admiration of the *Democracia* is this: "I hope that the day will come in which the Philippines will have towards us substantially the relations of Cuba." "From this speech," says the Manila editor, "is clearly to be inferred that the future policy for the Philippines—a matter by no means forgotten by the Federal party—is shortly to be an issue in the United States." What this friendly editor would have felt if he had realized that Secretary Taft does not so much as wish to discuss independence for a hundred years or so, may be imagined by the sympathetic.

The point is, of course, that here you have the official organ of the pro-American party not only discussing independence, but welcoming it. Note, too, that these Federalists are not misled by the vaporings of Boston Anti-Imperialists, nor by the kind of agitation which Secretary Taft has told us befogs the Filipino mind. On the contrary, the *Democracia* is commenting on Administration bills in Congress, on reports of Mr. Taft, and on a speech of Mr. Root. That is, if all the pesky Anti-Imperialists were sunk in Massachusetts Bay, these volatile Filipinos would apparently find food for their love of liberty in the official utterances of those who think independence is a very dangerous word to use. There could be no more beautiful proof of the fallacy into which Mr. Taft fell when he imagined that the question of independence could be put in cold-storage for a century. The platform of the Maryland Democrats last week, shows that if the Republicans think to burke this issue, the other party will take it up eagerly.

Not a few excellent results are likely to flow from the action of the Presbyterian General Assembly last week in modifying its attitude towards the question of marriage and divorce. An effort has been made to bring about a "church comity" in the matter of marriages of divorced persons. It was urged that the divorce problem would in considerable measure be solved if the clergy of one church would agree not to perform the marriage ceremony for persons of other churches who were under the ban. It was contended among Presbyterians, however, that, as they had their own rules, and as, under these, persons debarred by other marriage services could in some cases properly be united, there was no call for action on the part of the General Assembly. Yet the latter adopted a resolution in favor of refusing to perform service for any person whose marriage was prohibited by his own church, unless such action should work injustice to an innocent party in a divorce for Scriptural reasons. This action is a discouragement to divorce. It is also a step towards creating a stronger "courtesy of the profession" than has hitherto existed among the clergy of the various churches. And by keeping the different communions busy fighting a common evil, it will possibly make them forget that they are not really brothers.

The engravers of music have brought us to a pretty pass. They are comparatively few in number, are well paid, yet have always refused to join the lithographers' union. But now the latter has received the aid of the Musical Protective Association, which has just decreed that hereafter its members shall play no music that does not have the union label on it. This measure is to be carried through in no half-way manner. Care will be taken to see not only that the sheets are engraved by union labor, but that everything else from start to finish represents organized labor. The proper way would be, of course, to put a label on the white sheets, another across the ink, with a guarantee of the pure motives of the engravers, etc. But the Musical Protective Association proposes to do even better than this. Hereafter composers themselves must belong to the Association. In short, "the musical entertainment shall be union from the brain of the genius who composes to the execution of the artist who plays." This is a good idea; it will tend to eliminate that erratic character of genius which the moralists of all ages have deplored. Unfortunately, however, this new ruling will at the start apply only to band and orchestral compositions, whereas the greater portion of the music put upon the market is for piano and voices, and goes into the homes. There is no escape from it; the home must be unionized. They err who think this would be a difficult task. A proper amount of picketing and boycotting would do the work. The butcher, the baker, the candlestick maker—all unionized—would have to put on the screws for but a short time.

Liberal opposition to the Grand Trunk Pacific project broke down badly at Ottawa when it came to a vote. It made no difference that the scheme had been riddled in debate, that the Government was shown to be assuming dangerously large and indefinite liabilities, that there was no guarantee, except the success of the road itself, that the Eastern branch would compete disastrously with the Intercolonial (the Government) Railway—all these valid objections yielded to Sir Wilfrid Laurier's vague promises of great prosperity to come. Defenders of the scheme point to the fact that the Dominion, though guaranteeing three-quarters of the cost of construction, makes much better terms than formerly with

the Canadian Pacific; against which view it may be urged that the new transcontinental line is far less necessary. The Western Division from Winnipeg to Port Simpson, just south of the Alaska line, runs through a country rich in grain, timber, and minerals; the eastern division from Winnipeg through northern Ontario to Moncton, N. B., in its middle section, at least, lies through a region of very doubtful promise. For many years it will probably supply little but a too costly freight service for lumber, and open up a sporting region now comparatively inaccessible. It may be asked why Sir Wilfrid Laurier has staked his political fortunes on so doubtful a scheme. Partly because he is caught by the mere glitter of it, partly because he honestly wishes to rectify certain geographical anomalies under which the Dominion is suffering. The isolation of the populous provinces from each other tends undoubtedly to disunion, and Sir Wilfrid Laurier, in accepting what looks like a hard bargain with the Grand Trunk, may be guided not only by his immediate political star, but by a forward-looking patriotism. In fact, it is rather difficult to see anything improper in his attitude except perhaps an undue impatience to get a new transcontinental road—a sentiment akin to President Roosevelt's about the Panama ditch.

Though the French Ambassador read the riot act rather peremptorily to the Papal Secretary, there was apparently nothing in the now famous protest of the Pope which could have been explained better in two hours than in an instant. In general, the note as published in *L'Humanité* contained a reaffirmation of the Pope's Temporal Power; a protest against the continued usurpation of the House of Savoy; and in especial a complaint that President Loubet was to visit the usurper "at the very seat of the Pontifical See, and in the very Apostolic Palace" (*i. e.*, the Quirinal). In the version sent to the Catholic Powers was contained the phrase, "And if, in spite of this, the Papal Nuncio remained in Paris, this was due solely to grave motives of an especial order." This clause, it appears, was omitted from the copy of the circular note sent to the French Foreign Office. In other words, the Vatican apologized to the Catholic Powers for not breaking off diplomatic relations with France, asserting that step to be justifiable, but for the moment inexpedient. Of course, the Papal Secretary will plead, and rightly, the secrecy of diplomatic correspondence, but that will not excuse him for issuing a threat superfluous at best and offensive if known. To withdraw the Nuncio would at least have been consistent; merely to say that he ought to be withdrawn was unworthy of a trained diplomat. Perhaps the most important inference to be drawn from the affair is that there is no hope for the reconciliation of the Papacy and the Kingdom of Italy during the life of the present Pope.

Premier Combes used very moderately his Parliamentary victory on Friday. The overwhelming majority which sustained his partial breach of diplomatic relations with the Vatican is a pretty clear indication that he might, if he wished, effect the denunciation of the Concordat. He realizes, however, the practical difficulties that surround such a course, and he seems to have a shrewd sense that the postponement of the rupture will keep the Church in a very salutary state of suspense. Personally, he stands uncommitted to any definite revision of the treaty with the Holy See. Instead, he asks for time, and gives assurances, which were hardly needed, that the Ministry favors the separation of Church and State. The debate brought out clearly the fact that the diplomatic breach is incomplete unless the Vatican chooses to make it definitive; an under-secretary still represents France at the Papal Court. Pius X. will hardly add that folly to a blunder already sufficiently regrettable.

In the tiff between President Loubet and the Pope, the King of Italy, who was formally dubbed a lawless usurper, was really the aggrieved person, so it is no wonder that certain zealous members of the Italian Parliament have demanded some sort of formal rebuke of the Pope. Premier Giolitti neatly evaded the embarrassment of moving a Parliamentary censure upon an infallible Pontiff by recalling that the hostility of Pius X. had happily elicited the most gratifying expressions of friendship from France. So far from being a matter of regret, the Papal protest had really cemented the Franco-Italian *entente* and strengthened the House of Savoy. A certain conventional, not to say farcical, element in the fiction of Temporal Power is clearly shown in the permission granted to Cardinal Svampa to meet the King at Bologna, shortly after the publication of the now famous circular note. Svampa is an ecclesiastic of the most liberal type, but he was permitted to accept an audience with the King at Bologna, once a part of the Papal States. That suggests that the Papal claims have much abated, and that the quarrel with the House of Savoy, though bitter in theory, is largely tactical. Giolitti's easygoing comment on the Pope's recent indiscretion is in striking contrast to the celestial ire manifested in the French Chamber of Deputies.

The legislative programme recently unfolded by Mr. Watson, the new Premier of Australia, contains no startling features. Indeed, it raises the hope that the Labor party may use its control of the Government with moderation. Mr. Watson displays a capacity to look at the situation broadly, and except in one or two particulars his policy cannot be viewed as extreme by the Australians. He has accepted the Conciliation and Arbitration bill of his predecessor, modifying it merely to the extent of including railway and other State employees. It was this last provision that wrecked the Deakin Ministry. An attempt will be made to introduce federal old-age pensions, and state control of the tobacco trade is advocated; but the various nations of the earth have become hardened to such contingencies. Premier Watson also hopes to pass a banking bill with conservative provisions regarding cash reserves. His new programme is along the line of more completely solidifying the Commonwealth. A capital-site bill will be pressed, and also one appointing a high commissioner in London, who shall supersede the representatives of the various States. In short, the Labor party has shown no desire as yet to administer the Government in its shirt-sleeves.

The latest news of the battle of Kinchow at once emphasizes the disaster of the defeat and the frightful costliness of the victory. There can be no doubt that Gen. Stoessel hoped to hold Nan-shan Heights indefinitely. Otherwise he would never have mounted upwards of seventy guns at that point, including heavy pieces from the dismantled ships. By the loss of this artillery the armament of Port Arthur is appreciably weakened. Indeed, it is hard to see how the storming of the fortress itself can offer much greater difficulties than the taking of Nan-shan Hill. It appears to have been the remarkable artillery service of the Japanese that made the victory of last week possible after the reckless daring of the charging infantry had been spent in vain. We read, though the report is not specific, of entire charging columns annihilated, as certain Union regiments were before Petersburg. That Port Arthur can long hold out against the tactics that won at Kinchow is very doubtful. The landward defences are still far from strong, and the sea batteries are dangerously exposed to fire from behind. Stoessel's billeting of so many guns on Nan-shan Heights implies that he regarded the neck of Kinchow as his real defence in the rear. We may expect, then, a direct attack upon the Port Arthur forts as soon as the Japanese artillery can be brought up. Gen. Oku is fortunate in having troops who have put away the fear of death, for the storming of Port Arthur will probably mean not one but many an engagement as bloody as that of Wednesday week.

THE DEMOCRATIC CONCENTRATION

Republican dreams about a hopelessly divided and incurably foolish Democracy are in the way of being rudely dispelled. Every successive convention brings nearer Democratic sanity and Democratic harmony. In Ohio last week the repudiation of Bryan, Hearst, and all their works was emphatic. The conservatives of the party were in full control. Scarcely less gratifying is the fact that State after State in the South is fighting shy of the old monetary delusions. This makes it certain that there is no more likelihood of the Kansas City platform being "reaffirmed" at St. Louis than there is that the Ptolemaic system will be dragged from its tomb. Say not the struggles of 1896 and 1900 naught availed. They settled for this country the question of the standard of value, and it will not be reopened. The Democratic party will not again tie the millstone of free silver about its neck.

To cut away a dead issue is, of course, not sufficient. That simply puts a party in condition to make a campaign; but the campaign itself has to get impetus from ideas that are alive. Here, too, there are signs of an increasing harmony of Democratic sentiment. The party, like any Opposition, must seize the openings offered by the Administration. How it proposes to do so, we may fairly infer from the various State platforms already adopted. Republican extravagance is to be attacked. It is as gross as a mountain. It is confessed and deplored by Republicans. We are headed straight for a Treasury deficit, and swollen appropriations are the main cause. Furthermore, the country will be asked to pronounce against a rampant, costly, and dangerous spirit of militarism in the Government; against lawless usurpations by the Executive; against corruption in the public service and particularly against a partisan refusal to have it thoroughly investigated. Finally, the abuses of a monopoly-fostering tariff will be assailed. In spite of the complacent belief of the *Tribune* that no one will dare lisp a word against protection in the coming campaign, we shall hear the inequalities, the injustices, the outrages of our existing tariff denounced by a thousand orators. Good rallying cries the Democrats have in abundance; and there is more and more agreement about the ones to be made prominent.

Concentration upon issues has proceeded more rapidly than upon candidates. Judge Parker is adding every week to the number of his delegates. Alabama and Tennessee have declared for him, and he will undoubtedly have a long lead on the first ballot at St. Louis. Yet the convention will contain a large number of uninstructed and, it appears at present, undecided members —enough, undoubtedly, to defeat Parker if they could be got unanimously and enthusiastically to go for some other man. But can they? Where is the dark horse darker than Judge Parker himself? It is not necessary to say anything of the rumored plan to "stampede" the convention. We have just seen in Illinois how little likely an advertised stampede is to come off.

Those who predict Parker's defeat at St. Louis fall back upon general reasoning about conventions. Combinations to kill off the leading candidate are common; therefore, the others will unite after the first ballot upon some other man. But this is to forget that the leading candidate thus combined against has usually made himself offensive to the followers of others. He has remorselessly fought his way to the front over their bodies, and has left rancors and bitterness along his track. This, however, is not true of Judge Parker. Even those who oppose him have no personal grievance to allege, or unfair tactics on his part to parade. If he has awakened no great enthusiasm, he has at least provoked no animosities. Consequently, the ordinary motives to get up a union of votes against *this* leading candidate are wanting. Besides, where is the man upon whom it will be easier to unite than upon Judge Parker? The widely known Democrats are impossible. Gorman, Hill, Pattison, Tom Johnson, Bryan, Mayor Harrison—it would excite ridicule to propose to combine upon either of them. But if it must, then, be a case of taking up an unknown, who can pose as more available than Parker? This is the question which those who prophesy Parker's failure to get the nomination do not answer. "Oh," they say glibly, "any man can do it." But the reply is, like Lincoln's to Senator Wade, "Yes, but it takes *some* man to do it, and who is the man?"

Is he Mayor McClellan? His name is oftenest used in this connection. But what would it mean to the Democracy at large? The name, to be sure, of a gentleman, and of an official who has won praise from his opponents—more, really, than from his supporters; but it would be the name, primarily, of a Tammany nominee; more narrowly, of a Murphy protégé. How Judge Parker could be passed over for him, we confess that we are unable to see. If Hill is offensive, Murphy is more so. If factional differences in New York are dreaded, Tammany domination of the party would be hated. As for Murphy, he has thrown off his mask. His pretence of being for Cleveland is now seen to be hollow. He meant McClellan all along. To make Tammany—alias Murphy—supreme in State and nation as well as in New York, was his real ambition. But his leadership already stands for failure. Arrogantly setting up to be a State boss, he was beaten in a square fight. Even in his own city his position is insecure, being undermined every day. Thus a movement to nominate Mayor McClellan at St. Louis would be practically a movement to restore the waning prestige of a Tammany boss. We do not say that it will not be attempted, or that it will surely fail; but we refuse to believe it until we see it.

QUAY.

The national shame of a public career like the late Matthew S. Quay's could be made more blistering in only one way—by glozing over in his death the frightful evil of his life. We are glad to see that there is some plain speaking. A few Republican newspapers that have not the courage to tell the truth about Quay, at least are significantly silent. But there is an appalling amount of crouching over his grave "with craven soul and fettered lip." Lamentably, the attempt to make out this gigantic political corruptionist other than he was, begins with that white-souled champion of reform, that flaming hater of all that Quay stood for, Theodore Roosevelt. His shocked friends could have read only with a groan that telegram of condolence in which the President, taking pains to say that his message was not a cold official utterance, but a personal one, spoke of Quay as "my stanch and loyal friend."

Was he, however, a friend of decency in politics? Was he a friend of honesty in public life? Was he not, rather, the friend of jobbers and bribers, an adept in political methods the most abhorrent and demoralizing known to his generation, the chief agent in making Pennsylvania politics besotted, Philadelphia politics sodden, and, so far as he was able, the policy and personnel of his party an offence to the nostrils? No one knows better than Mr. Roosevelt. No one has written bitterer words than he about the men of Quay's class—"those sinister beings who batten on the evil of our political system." It was precisely Quay and his kind that Theodore Roosevelt had in mind when he said that "the real and dangerous foe is the corrupt politician." And it was a condemnation of his own present attitude which he penned when he wrote that "it is a dreadful thing" to "condone misconduct in a public man," and affirmed that the "shame" of politics is to "deify mere success without regard to the moral qualities lying behind it."

Senator Quay's political example has been consistently vicious. It was bad all through. He had no concealments. "If I had lived in New York," he once said, "I should have been a Tammany man." That is, he would have gone in for plunder. But in Pennsylvania and Philadelphia the loot had a Republican label on it; consequently, he was a Republican. Absolutely cynical, he never

pretended to look upon politics except as an exciting game in which glittering stakes were to be won by the cool-headed and the unscrupulous. Just as he gambled in the stock market, so he made huge wagers in politics, and out of both got satisfaction for his gamester's passion with large pecuniary returns. Beginning his political course by using the office of State Treasurer in a way to bring him within the shadow of prison walls, he steadily played the game thereafter, with parties as but so many horses on which to lay odds, and elections nothing but a grand sweepstakes. He won; but what of that, so long as he was compelled to stand up before the eyes of his countrymen bearing "the shameful brand of public fraud"?

Mr. Quay did not create the conditions upon which he rose to his bad eminence; he simply used them with singular skill and without one scruple. His lot it was to live in a State which, from the earliest days of our existence as a nation, has been foremost in asserting it to be the duty of the Government to make the individual rich. Joined to the idols of protection, Pennsylvania has best illustrated its inherent tendency to political corruption. Tariff favors are worth paying for. Once obtained, they come to be regarded as a sort of property right, and a man will pay out half his property in order to avoid losing the rest. Quay was able to put that two and two together. Put money in thy purse, was his one political motto. He got funds from the protected manufacturers and from their federated beneficiaries in sums without previous parallel. Just to make himself State chairman—merely to win a fight within the party—he spent $200,000. Yet the Lincoln campaign of 1860 cost in Pennsylvania only $12,000! Quay hit up the pace fearfully. He bought the organization, bribed or intimidated the press, got his grip on the public service, including even the courts; imposed his will on Congress and Cabinets, and upon at least three Presidents—making the latter provide for the offal of his machine, which even Pennsylvania could no longer stomach—and all without identifying his name with a single measure of public good, without making a speech or uttering a party watchword, without even pretending to be honest, but solely because, like Judas, he carried the bag and could buy whom he would.

To hold up such a man as a "friend" is to make the devil chuckle. President Roosevelt has been pretty complacent on more than one occasion over the skilful way in which he had "used" Quay. "You say I have no diplomacy; but see how often Quay has cracked the whip over the Pennsylvania delegation and made it vote to support me." But the art of touching pitch without being defiled has not yet been discovered. No President could "use" a corruptionist such as Quay without being, in the act, used by him. In every bargain of that kind, it is the President who gets cheated. He wins votes, it may be, but he loses his good name and throws away his influence. No; we may have to put up with men of the Quay type for a time yet—we cannot eliminate them from our politics; but there is only one thing for honest men to do—to fight them while they live, and to speak the truth about them after they are dead. Endangered States may be compelled to "stoop their proud necks" to many disagreeable necessities; but it can never be necessary to call evil good. To compromise with a living public corrupter is recreancy; to praise a dead one is treason.

PRESBYTERIAN UNION.

Mergers are in the air, in the ecclesiastic as well as the financial world; and the action of the General Assembly at Buffalo looking to union with the Cumberland Presbyterian Church, and even, ultimately, to reunion with the Presbyterians of the South, is but part of one of the large movements of the day. Still, the decisive vote to take in the Cumberland Presbyterians has a significance wider than a mere readjustment of church organization. Its doctrinal implications are almost startling, for the Cumberland church rejects at least three of the "five points" of Calvinism, and is more than suspected of Arminianism. The overlooking of this is a noteworthy sign of the times.

Ex-President Patton of Princeton fought, as usual, a magnificent rear-guard action. His guns point backward more consistently than those of any theologian of his day. From the time that he prosecuted Professor Swing in Chicago down to his solemn protests last week, he has stood valiantly for the faith once delivered to John Calvin. Time and again the tide of battle has rolled over him; but at the next engagement his flag of the five bars has flown as defiantly as ever, and Athanasius again has defied the world, the *Zeit-Geist* and all his works. He opposed revision of the creed tooth and nail, asserting that an emasculated Calvinism was next door to the synagogue of Satan; and, now that revision has been accomplished, he stoutly denies that it meant anything in particular. Others may change; Dr. Patton is immovable.

That this attitude is in many respects admirable, we should be among the first to admit. It is something, in an age of flux and flabbiness, to find a man who has a sinewy mind and believes absolutely in the validity of its logical processes—ready to affirm that all men are wrong rather than admit a flaw in his own reasoning. For it is, apparently, the intellectual symmetry of Calvinism which commends the system to Professor Patton. As upon so many other mighty thinkers, its logic has laid a spell upon him. Considered merely as a means of condemning the uncounted millions of the human race to hell without a single lapse in arguing from the premises, the Calvinistic theology may claim undisputed eminence. Granting its assumptions, it is objection-proof—like other forms of fatalism. Into this we have no thought of going; but what leaves us wondering is Dr. Patton's air of defending, not a theological system, but a precious belief of actual flesh-and-blood Presbyterians of to-day. Now, as a matter of fact, we venture to say, not one Presbyterian in ten could even state the doctrines of Calvinism correctly, and not one in a hundred would accept them in their stark original form. They are not preached from the pulpit; the pews are more and more ignorant of them. Jonathan Edwards could no more preach to-day his sermon on "Sinners in the Hands of an Angry God" than he could enforce the rules of the Presbyterian or Methodist Church against "worldly amusements."

For saying this, we may again be charged with presuming to know more about the churches than do the clergy themselves. But nothing is more useful to ministers than frequent reminders how hard it is for them to find out what their parishioners really think. A clergyman is like a President, or a boss; no one tells him the exact truth. He is surrounded by people who are in an unconscious conspiracy to deceive him. Only a very alert or sagacious minister can penetrate through the pious platitudes and acquiescences of his hearers, and arrive at their real views of religion, not to speak of the infinitely harder task of discovering their actual notions of theology. The sort of mental click, shutting off frankness, which Emerson heard in the Anglican Bishop, must be a familiar sound to a sharp-eared clergyman. And just in proportion to his success in detecting the thought of church-people to-day will be his conviction that theological doctrine, as such, has but the slightest meaning to them and the frailest hold upon them. That formal dress of religion has, in the minds of the great majority of the Christian commonalty, waxed old as doth a garment, and as a vesture it is changed.

In such a time of theological break-up, the patient searcher after truth has a hard time of it, as Principal Tulloch explained. On the one hand he has to encounter "the bigotries of an omniscient science," and on the other the "jealousies of an omniscient theology." To give all truth its due and to recognize and explore facts of whatever kind, refusing to affirm where the grounds of affirmation are wanting—only in that way can progress be made. And there is a law of progress even in theology. Dorner wrote of it, and his incidental comment reads almost like a melancholy reference

to what President Patton was engaged in last week:

"Whosoever, at crises when the Church is called upon to quit an old path and to enter upon a new sphere, both of thought and speech, persists in keeping to the old, will be left behind; and not the firmest confidence in the justice of his own position, nor the greatest authorities of former ages, can save an orthodoxy so obsolete."

AN IMPASSIVE STATESMAN.

In moving the erection of a Parliamentary memorial to the late Lord Salisbury, Mr. Balfour had a delicate duty, of which he acquitted himself most gracefully. He recalled that in the case of Disraeli and Gladstone this pious office fell to a political opponent unembarrassed by personal ties, while the expansive nature of Salisbury's two great predecessors gave every opportunity to the official eulogist. Mr. Balfour, on the contrary, was bound by the closest personal obligations to his uncle and former chief. Without Lord Salisbury's advice and encouragement he would hardly have undertaken a Parliamentary career. Furthermore, the well-known reticence of Lord Salisbury, his mistrust of sentiment, his detachment from his associates, his disregard of popular applause, made anything like a fervent appreciation a posthumous affront. Such considerations held Mr. Balfour to reticence and brevity.

Indeed, he devoted most of his speech to the elucidation of this stoical attitude of a great statesman. "I have never known him to speak of himself," he said of Lord Salisbury. He seldom, even in practical life, gave a reason for or against any course of action which went beyond the actual needs of the moment.

"It would be most unfair, I think, to say of Lord Beaconsfield that he was theatrical; but it would not be unfair to say that he had no objection to a picturesque or dramatic situation in which he was an important figure. It would be most unfair to say of Mr. Gladstone that he was greedy of popular applause; yet, rightly, I think, he I am sure was moved by the fervor of popular admiration which his genius was so eminently fitted to elicit. Lord Salisbury was, I believe, absolutely without any feelings of that kind at all. For good or for evil—and I do not say that it was wholly for good—he was completely indifferent to popular applause, or to applause of any kind, popular or otherwise; and that is so far apart from the ordinary feelings, or it may sometimes be the weakness, of humanity, that it makes his portraiture very difficult to draw."

Yet the figure of an impassive statesman emerged impressively in such a fact as that, for the thirty-six years after Lord Salisbury ceased to be a member of the Commons, he never came back to hear a debate. No wonder, then, that he rarely knew his younger Cabinet associates by sight, and is said never so much as to have set eyes on his formidable antagonist Parnell.

Such an obliviousness to considerations of personal association and popular applause should not be mistaken for arrogance. One cannot conceive Lord Salisbury so far forgetting himself as to say, "The public be damned." His inflexibility was based on the assurance of his personal rectitude and of his prerogative as an aristocrat. Indeed, it may be seriously questioned if this unemotional view of politics is tolerable except under feudal conditions. It is instructive, for example, that a close parallel to Lord Salisbury's method was Richard Croker's rule over his machine. Let the parallel appall no one. Salisbury himself could not have swayed large issues more dispassionately or with a more complete disregard of personalities, and we have the very curious spectacle of plebeian Machiavellianism and aristocratic absolutism carrying an identical front towards the world. Why an impassivity which is admired in a British Premier and an American boss would be fatal in an American statesman, it may be worth while to inquire; for the discrepancy certainly implies that the party machine is the least democratic, the least American institution we have developed. Certainly our Congressional life, widely tolerant as it is, would not put up with any such assumption of superiority as was habitual with Lord Salisbury. Our Presidents, too, have not generally erred on the side of reticence. Even Mr. Cleveland, who honestly hated mere palaver, used sometimes to come out with frank denunciation or orotund personal statement.

If Lord Salisbury's impassivity was excessive, it still marked a superiority in the man and in the system that accepted him at his impersonal political value. For it is not to be supposed that the title of Marquis would have carried Salisbury through had he not possessed the abilities that he refused to exercise for his own credit. The man who partitioned Africa peacefully, needed to make no explanation that he was a born diplomat. Yet Lord Salisbury's position as an aristocrat did get him his chance originally. To a man of his temperament, a republic would hardly have yielded it, and that is one reason why the more uncompromising sort of ability is practically never found in our politics. For let us make no mistake. We need not condemn Cavour and Sumner because they were not self-contained men of Lord Salisbury's type, but we cannot fail to note the real distinction that was Salisbury's in a period of political garrulity. It is simply impossible that a statesman should gabble to all comers, exude vague comment upon every occasion, frequently take the temperature of his popularity, consider the strategic effect of his next public appearance, and still give his best powers to the work of administration. So the really significant feature of Lord Salisbury's isolation is not the personal superiority it lent him, but the leisure it procured him for great achievement. He had serious business to do, and could not be diverted by his own feelings or those of others. A chief problem of republics will be so far to reduce the price of popularity that dispassionate ability like Lord Salisbury's may be had at need. Personally, there can be no doubt that his austere memory makes most of the leaders in England and elsewhere seem cheap.

THE PROGRESS OF THE WAR.

After four months of preliminary manœuvring, the situation on land has declared itself. Gen Oku is in contact with the garrison of Port Arthur, which he outnumbers more than two to one. He has carried the first line of defence at Kinchow with a skill and intrepidity worthy of all praise. Kuropatkin has elected to make his stand along the line of the railroad from Hai-Cheng to Mukden, a line one hundred miles long, with perhaps 100,000 men. Kuroki, with a somewhat superior force, is ready to strike at the Russian right, while a simultaneous movement towards Liaoyang threatens the communications to the north. Rumors of a reconnoissance north of Mukden seem of little significance, and, as a matter of fact, Rennenkampf, with his superb brigade of Cossacks, is in a way to make trouble all along the Japanese right. Cavalry engagements in eastern Korea and along the Seul-Wiju road seem to be raids of no consequence.

So far the advantage is clearly with the Japanese. Kuropatkin has been forced to a defensive attitude, and is apparently hopelessly tied to the railroad. Gen. Zassalitch's fruitless defence of the Yalu has cost him dear. The Japanese have made good progress through very difficult country almost without loss, and are in a position to hurl superior numbers against almost any part of the long Russian line. Meanwhile, the complete blockade of Port Arthur will probably hasten the landing of a third Japanese army near Niu-Chwang, from which they will threaten Kuropatkin's right and rear. Yet he cannot well resist this attack without dangerously exposing his communications. Accordingly, it is very likely that he will choose a less dangerous defensive base than Hai-Cheng—probably at Liaoyang, or even Mukden. His natural policy would be to avoid a general engagement and wait for reinforcements and the rainy season. The Japanese, on the contrary, must press their initial advantage or largely sacrifice the strategic gain they have made.

What forced Kuropatkin to this rather humiliating policy of merely holding the railway seems to have been not the numerical inferiority, but the low morale of his army. On this matter the military critics of *Figaro* and the London *Times* are agreed. The latter shows instructively that the 223,000 troops, of which only about 140,000 are available for the field, are composed almost en-

tirely of raw regiments of the reservist type. The old organizations have been stretched to the breaking-point. Thus, six brigades which last autumn consisted of forty-eight undermanned battalions, now consist of 108, "officers and men equally ignorant of each other and of the country." From the two Siberian reserve brigades, again, consisting of eight battalions, forty-eight have been evolved. It is little wonder that Gen. Zarubaieff's Fourth Army Corps, thus constituted, has not yet been reported east of Lake Baikal. Summing up the situation, the *Times* critic estimates Kuropatkin's maximum force south of Mukden at 100,000, and characterizes it as "a shabby improvisation, possessing none of the qualities that make an army formidable save good arms, gallantry, and fine physique." In the transport and artillery service the condition is presumably worse, and it may be suspected that the army is dangerously immobile and unable to cope quickly with Kuroki's skilfully masked operations. So much may safely be inferred from the fact that Kuropatkin neither struck at Kuroki shortly after the battle of the Yalu, nor even harassed seriously the advance to the Mantchurian watershed. Indeed, in view of the wholly defensive policy of Kuropatkin, the costly resistance at the Yalu and the retention of Port Arthur equally seem blunders.

Of the awkwardness of a situation in which the penetrating of his line at any point means the cutting of his communications, Kuropatkin must make the best. It is merely another instance of the extension of Russian sway being also its weakness. For the general military unpreparedness, for the policy of manning the Far Eastern divisions with inferior troops, the ex-Minister of War must, with the entire Russian bureaucracy, assume a large responsibility. How far the Japanese may be able to profit by the demoralization of their foes it would be unsafe to predict. The censorship prevents accurate news of their mobilization from reaching the Western world, and scanty advices from the front evidently have had all unfavorablbe comment officially eliminated. It is known, however, that for the present they are in considerable numerical superiority; that they are more mobile; that their supply service is excellent and especially well adapted to the mountainous country in which they are operating. Their chief present embarrassment is the difficulty of a descent upon Niu-Chwang. Until Kuroki is actually in contact with the Russians at Hai-Cheng —a move for which he is yet unready— a landing party would be in danger of being caught promptly between the Russians and the sea.

For the moment, then, Port Arthur is the critical point. Its fall would release Kuroki's army from their mountain fastnesses, supplying also reinforcements for an enveloping movement which would force the Russians well back toward Mukden. But time is the all-important matter. The July rains will almost force an armistice. The remarkable strategy of the Japanese must be put to the stretch to compass the storming of Port Arthur and a general advance upon Kuropatkin within the next few weeks. The gallantry with which the neck of Kinchow and the heights of Nanshan were forced on Wednesday week shows that the valor of the Japanese infantry is equal to the tactics of their generals.

AN UNNOTED POLITICAL FACT.

LONDON, May 19, 1904.

The one feature in English public life which, unnoted though it be, deserves attention, is the increasing power of the Labor party. Trade-unionists may, in the next Parliament, be masters of the situation.

The accidents of the moment tell strongly in favor of the Labor party. Members of the Opposition and Ministerialists, Free Traders and Protectionists, are equally prepared to do homage to trade-unionism. Liberals cannot praise too highly artisans who, though caring nothing for individual liberty, are prepared to stand up for free trade, and, at any rate, to oppose a tax upon corn. Protectionists, on the other hand, perceive truly enough that the men who deprecate free trade in labor are not likely long to support absolute free trade in goods. Protectionists pardon the accidental opponents of to-day because in trade-unionists they see the firm allies of to-morrow. Even as things now stand, workingmen are well pleased to be protected against the competition of aliens. Protection is, after all, first cousin if not twin-brother to Socialism.

The increasing authority, again, of Socialism—or, as it may more fairly be termed, Collectivism—is no transitory phenomenon, and, as it grows, gives additional power to trade-unionism. Any observer who calmly looks back over the English legislation of the last thirty years, will be amazed at the prodigious ascendency gradually obtained by ideas which, between 1848 and 1860, were denounced, or derided, as Socialism. The violence and failures of revolutionists had at that time made any attempt to realize social utopias an object not so much of hatred as of ridicule. Yet, even in 1848, the humanitarianism of the day had laid the foundations of that vast and expansive labor code which in England is a monument of the successful effort to place the control of labor in the hands of the State. The real character of a social revolution carried through under the guidance of Tories, such as Lord Shaftesbury, who themselves were as little inclined to become Socialists as to turn democrats, was utterly concealed from the philanthropists to whose energy is due the earliest practical triumphs of unrecognized and unsystematic collectivism. The factory movement fostered ideas unknown to most of its leaders. By, if not before, 1880, socialistic ideals had begun to affect English legislation. The wide extension of the Factory acts; the laws which from 1870 onwards, and especially in 1881, have made the tenure of land in Ireland a matter rather of status than of contract; the Combination act of 1875, the Workmen's Compensation acts, and a score more of Parliamentary enactments have all tended in the direction of Socialism, and have all impressed upon the workingmen of England the lesson which always finds a large body of apt scholars, that the poor can obtain material comfort far more easily by the aid of the State (that is, by drawing money from the pockets of their neighbors) than by reliance on self-help. Hence, the legislation of the last thirty years has created a moral atmosphere favorable to the growth of trade-unionism, and deadly to the old Benthamite Liberalism which governed English legislation between 1830 and 1870.

Whoever doubts the strength of this new Socialism should cast his eye over the bills introduced into Parliament during the present session, and should also carefully note the fortunes of one or two of them. The private members who bring in bills to meet the supposed wishes of the working classes, offer large and attractive promises. Local bodies are to acquire the power to raise an unlimited amount of rates for the purpose of public libraries; cottage homes are to be provided for the aged poor; loans at low interest are to be made to local authorities for the building of houses for the working classes; a wages board is to be appointed which is to fix a minimum rate of wages; above all, old-age pensions are to be provided for all the deserving poor at the age of sixty-five, and the feelings, no less than the pockets, of the poor are carefully protected. Great care is to be taken that money received from the public, which heartless economists might term out-door relief, shall inflict on deserving poverty neither the disabilities nor the discredit which have hitherto accompanied pauperism. But all this is not enough. Many an energetic workingman who, greatly to his credit, does not wish to receive relief of any kind, is yet earnestly bent on enforcing upon a dissentient minority, by so-called moral pressure, obedience to the laws of his trade-union.

In 1875, trade-unions were placed in a situation of privilege. Combinations for "the furtherance of a trade dispute," to use the queer expression of the Conspiracy and Protection of Property Act, 1875, were then declared by law not to be criminal conspiracies, though similar combinations for other objects—*e. g.*, for inducing landlords to lower the rents of tenants—may well be criminal conspiracies, and severely punishable. But trade-unionists are still unsatisfied; they have found to their surprise that the judges, at any rate, understand the duty of protecting individual freedom. The courts, they find, give decisions which render effective picketing a crime, and which make trade-unions, like every other person or body throughout the country, liable to pay damages for torts done by their agents in the course of their employment. To carry on a strike with vigor has, we are told, become an impossibility. The modest claim is now made—and many members of Parliament are ready enough to concede its justice—that men engaged in a trade dispute should in effect be entirely exempted from the operation of the law of conspiracy; that what is humorously called "peaceful picketing" should be completely

legalized; and, lastly, that "an action shall not be brought against a trade-union . . . for the recovery of damage sustained by any person or persons by reason of the action of a member, or members, of such trade-union." This last piece of proposed legislation would in effect make it possible for a trade-union to encourage, to instigate or order an assault upon any man who violated the rules of the union, and to be exempt as a union from any liability to pay damages for the assault. The clause copied from a bill which has been laid before Parliament is probably ill-drawn and goes further than its proposers intend; but it expresses clearly enough the idea which underlies the policy and the ethics of trade-unionism—namely, that a union has a moral and ought to have a legal right to bring the very utmost pressure, short of physical violence or threats of physical violence, to bear upon men who were mean or wicked enough to use their legal rights in ways condemned by the moral code of trade-unionism.

That few of the bills to which I have referred will immediately pass into law, is probable enough. The proposals, however, laid before Parliament prove how earnest is even now the desire of politicians to meet the views of trade-unionists, and their abject dread of opposing the real or supposed wishes of wage-earners. Two examples will show my meaning. Both theory and (since 1834) experience have proved that the curtailment of outdoor relief is the only way under the English Poor Law of maintaining the independence, and in the long run promoting the prosperity, of the working classes; yet within the last few weeks a bill has been favorably received in Parliament, which in effect compels boards of guardians to grant outdoor relief to any person otherwise requiring it without taking into account any sum, up to five shillings, which he may at the same time receive from a friendly society as sick pay. This bill, which will soon pass, if it has not already passed, into law, strikes at the very root of the principles embodied in the so-called New Poor Law of 1834—an act which, unpopular as it was, saved English laborers from destruction. Little more than a fortnight has passed since a bill came before the House of Commons which aimed at providing forthwith old-age pensions for poor and deserving persons of sixty-five. The scheme was absolutely unworkable. If carried out, it would have imposed a huge additional burden upon our already overtaxed nation. Almost every member who took part in the debate exposed, though often in guarded language, the defects of the measure. It was, you will assume, summarily thrown out. No such thing. No man pressed for a division; the bill has passed its second reading unopposed. That it will not become an act of Parliament may, one trusts, be taken for granted; but members of Parliament have gained their object. None of them will be taunted at the next general election with the refusal to give pensions to the aged and the poor.

The temporary gain to members of Parliament is obvious. Did any one of the men who was present, or studiously careful not to be present, at the debate, ask himself how much of self-respect, or of respect from his constituents, he could retain when he had made it manifest to every elector throughout the land that he dared not warn workingmen that their wishes were foolish or wrong? J. S. Mill, when canvassing for a seat in Parliament, was asked at a large meeting of artisans whether he had not said or written that English workingmen were given to lying. He answered (I speak only from memory) "Yes, I did," and the room rung with applause. Is the spirit of the men who applauded Mill dead and gone? Have the workingmen of England forgotten the respect due to honesty? I doubt it; but sycophants, whether they flatter kings or crowds, whether they are courtiers or members of Parliament, soon create tyrants.

From the present state of things, when the number of labor members is small and this small group lacks the guidance of a clever Parliamentary tactician, it is easy to judge how great will be the power of labor members when their number has increased and some adventurer, endowed with the gift (which is not a very rare one) of parliamentary management, has placed himself at their head. At the next general election, confused issues will perplex even honest electors. This confusion will increase the number and the power of men pledged to promote the exclusive interest of a particular class. We are probably approaching a serious political crisis. An outsider cannot but wonder at the calmness with which respectable politicians look on the present condition of affairs. To one fact they must surely have directed their attention. There are countries, such as Belgium, where the rise of Socialism has deprived Liberals, more or less of the old English type, not only of office but of all authority. This matter, which should be looked at together with the lessons to be derived from the recent developments of Australian democracy, deserves consideration. It suggests reflections which are anything but bright on the future of English public life.

AN OBSERVER.

LUIGI CHIALA.

CAMBRIDGE, MASS., May 23, 1904.

Senator Luigi Chiala died in Rome on April 27, a little more than seventy years old. He occupied a unique place among Italian historical writers; indeed, no other country in this generation has produced his counterpart. He wrote no formal history, but he edited the letters of the chief makers of modern Italian history in such wise that his works are indispensable, an integral part of the great chronicle of the Risorgimento. As long as the story of Italian independence is remembered, Chiala's commentaries on Cavour and La Marmora and their contemporaries are certain to be read. He was born at Ivrea in the Val d'Aosta on January 29, 1834; studied at the University of Turin; volunteered in the disastrous campaign of 1849; and then devoted himself to journalism. His ability soon attracted the notice of Cavour, and among his earliest works was 'Une Page d'Histoire du Gouvernement Représentatif en Piémont,' a revelation of the steps which led up to the famous coalition of Cavour and Rattazzi in 1852. This tract was so evidently written by some one on the inside that many readers persisted in attributing it to Cavour. The coalition, or "connubio," between the rival leaders had been brought about by their common friend, Michelangelo Castelli, one of those most efficient men who hold a relatively inconspicuous place in the public eye, but are the intimates to whom rulers and ministers turn for frank counsel. With him Chiala early formed a friendship which lasted till Castelli's death in 1875. During the fifties, Chiala edited the *Rivista Contemporanea*, a monthly magazine published at Turin, which served as the mouthpiece for the men of progress and patriotism who were transforming little Piedmont into a modern, liberal, and strong state. When Cavour wished to prepare public opinion for the death-grapple with Austria, he suggested to Chiala the main points of another tract, 'La Maison de Savoie et la Maison d'Autriche.'

The facile publicist volunteered for the war of 1859, serving in the Fourth Regiment of Grenadiers; saw the brief campaign of 1860, and remained in the army. In 1862 he founded *Italia Militare*, the principal military journal of Italy, which he conducted for four years. During the war of 1866 he was attached to the General Staff, and subsequently he was secretary of its chief, Gen. Govone. The alliance with Prussia, entered into doubtingly by General La Marmora, the then prime minister, and the defeat at Custozza, drew down on La Marmora an avalanche of hostile criticism. The young staff officer could not endure to see the general, whose confidence he had so long enjoyed, calumniated, and, having requested to be placed on the reserve list, so as to free his pen, he wrote in quick succession 'Le Général La Marmora et l'Alliance Prussienne' and 'La Politica Italiana e l'Amministrazione della Guerra dal 1861 al 1866.' In the former he justified the premier's acceptance of Bismarck's overtures; in the latter he set forth the policy which Italy had pursued after Cavour's death, and defended the War Office against the charge of incompetency and neglect.

In 1870 he resumed active service on the General Staff, with the rank of captain, and was appointed editor of the *Rivista Militare*, an army monthly, which he made flourish. In addition to his editorial work, he produced an elaborate monograph on the events of 1866, and after La Marmora's death (in January, 1878) he wrote a memorial which had a wide circulation and added 12,000 lire to the fund for the General's monument. But the chivalrous Capt. Chiala had already fallen into official disgrace by printing, in a commemoration of Victor Emanuel II., one of the King's letters to Baron Ricasoli—an act which Chiala's superiors in the War Department construed as insubordination. He was arrested and imprisoned at Civitavecchia; but fortunately he had spent only fifty days in that cheerless fortress when the administration changed hands, and Cairoli, the new prime minister, at once ordered his release. Chiala lost no time in resigning from the army for good.

To this episode we probably owe his monumental work, the six volumes of Cavour's Letters, the first volume of which, appearing in 1882, introduced Capt. Chiala's name to students of modern European history in all parts of the world. He found in Sig. Luigi Roux of Turin an energetic publisher, who made a specialty of bringing out important works on the Risorgimento. Elected from Turin to the Chamber of Dep-

uties in 1882, Capt. Chiala sat among the members of the historic Right until 1892, when he was created a Senator by King Humbert.

His edition of Cavour consumed nearly ten years. It was followed by Castelli's Letters and Memoirs; by three volumes of selections, with elucidation, from the editorial leaders of Giacomo Dina, a journalist, who, for thirty years, stood at the head of the Italian Liberal press; by a volume on the 'First Expedition to Massaua'; by three volumes of 'Pages of Contemporary History'; and by 'A Little More Light' on the events of 1866, the last work being issued a year ago. Besides these many books, there are others which deserve mention: 'Confidenze Politiche di due Uomini dabbene' (that is, Massimo D'Azeglio and Giacinto Collegno); 'L'Alleanza di Crimea'; and 'La Politica Segreta di Napoleone III. e di Cavour in Italia ed in Ungheria.' He had still another work in preparation at the time of his death.

This list of dates and titles testifies to Senator Chiala's astonishing industry; but mere industry is common, and many a writer who has filled a shelf with twenty-five volumes has been quickly, and deservedly, forgotten. It is Senator Chiala's distinction to have worked in a subject which, for Italians at least, can never lose interest, and to have contributed from his own talents a very unusual fair-mindedness and an almost unrivalled skill in tracing intricate political transactions, or in piecing together, from imperfect clues, a diplomatic negotiation. His knowledge of the traditions and practices of European cabinets since 1840 was simply unlimited. He knew the opinions of the public men of Italy, France, England, Germany, and Austria for fifty years; he had their memoirs and published correspondence by heart; and, so far as concerned Piedmont and Italy, he knew the secret springs of action behind legislation and behind diplomatic intrigues. He was as familiar with the gossip as with the archives. Taken into confidence by the statesmen of two generations, he never betrayed their secrets nor committed an indiscretion. He could be the friend of two rivals without slighting either. This trustiness explains why he became so general a confidant.

It was most fortunate that so much of the material of the history of the Risorgimento came to such a man for editing. The unification of Italy was not achieved without arousing violent partisan animosities. There were Mazzinians, who hated the Cavourians almost more bitterly than the Austrians; there were intransigent Democrats, irreconcilable Clericals. Senator Chiala treated them all fairly, taking pains to give to each his due as a helper towards national regeneration. Instead of partisan narrowness and sectarian exclusiveness, he kept in view the ideals which embraced all parties. He accomplished this not by an easy indifferentism, nor by a sacrifice of his own opinions, which were clear and firm, but by a genuine passion for fairness. And as no other Italian of his generation has done more to promote goodwill among his countrymen, so no other has surpassed him in effectively defending the policy of Italy against foreign accusers. His exposition of the affairs of 1866, for instance, may well be final.

He was a commentator rather than a biographer or historian. Give him a collection of letters or a batch of political articles, and he would set them in proper order, explain the connection of one with another, clear up every allusion, cite, if need be, a dozen passages mutually remote to complete the understanding of a line, and so put the reader in possession of all the data needed for forming an opinion. Thanks to this method, he imbedded in his books much fugitive material that might otherwise have been lost; but this method, which serves so admirably his purpose, is of course too diffuse, too discursive, for formal history. Nearly ten years ago I urged him to recast his introductions to the six volumes of Cavour's Letters in the form of an independent biography. They make more than 2,000 pages, which, by condensation such as would suit a biography, might be reduced one-half. But he said to me that it was too late: he had neither time nor means to undertake such a work, although if he had realized at the outset how voluminous a commentary the letters would require, he should have adopted a different plan.

To those who knew him, the personality of Senator Chiala was most sympathetic. He was tall, above six feet in height; and in the later years, when my relations with him began, his hair, moustache, and imperial were white. He had a soldier's rather than a scholar's bearing; but in manner he was very gentle, a model of urbanity. You never came to the end of his information in his chosen field or of his liberality in imparting it, and a talk with him was worth much reading as a proof of the innate genius of the Italians for diplomacy. He was most generous in praising what he deemed excellent, and his praise carried great weight. I well recall the satisfaction which the last important survivor of the Mazzinian inner circle expressed when I told her that Chiala had recommended to me in high terms her 'Life of Bertani.' Though he and she were leagues apart in politics, yet she knew that he was just. He lived frugally, like so many of the intellectual élite in Italy, drawing a small stipend, I believe, as a secretary of the Senate, but chiefly dependent on his writings for his support. He worked conscientiously without scanting, and without rest. In his books as in his life, he personified the *galantuomo*—the chivalrous, honest, fair-minded gentleman; the type to which the modern Italians look up as their ideal.

WILLIAM ROSCOE THAYER.

THE PARIS SALONS.

PARIS, May, 1904.

The miracle has not happened. A new generation of young geniuses has not sprung up since last summer. The tradition of dull efficiency is still maintained at the Old Salon; at the New Salon, technical sensationalism, technical eccentricity, has become little better than the merest convention. Indeed, this, I think, is felt in the exhibition of the younger society more and more as the years go on. The methods and problems that seemed such daring experiments a few years ago, that seemed to foreshadow such a brilliant future, have degenerated into formulas as binding as those that rule the older society. And by constant repetition of the same themes and the same treatment, the painters who were thought so original are fast losing whatever quality of freshness, whatever genuine research, they once brought to their work. Their sense of proportion seems to be deserting them, beginning with their President, M. Carolus-Duran, who, however, by his fidelity to academical standards belongs by rights to the other Salon. In his case it is the preoccupation with the meretricious splendor his sitters evidently delight in that has grown upon him until now little else remains in his portraits, and his two this year are as barren of all artistic interest as the showy stage trappings of a popular theatre. M. Boldini, whose realism has sometimes come very near betraying him into caricature, now tumbles into the trap headlong; and his two portraits of women, one arrayed in the height of the present fashion and the other in a sham classic costume, are frankly caricatures, which might be amusing in their grotesque exaggeration were it not for the tragedy of seeing a painter of M. Boldini's ability recklessly squandering his talents. M. Gandara, one feels, is so taken up with the symbols of social correctness that he threatens to go the same way—he has, among other things, a portrait of a man that is almost offensive in its smug "smartness." Of M. Besnard's portraits, I say nothing. They are unworthy of him, and not even the personality of the late Princesse Mathilde can suffice to give interest to the most important of the three. M. Aman-Jean, it is true, endeavors, but without success, to escape the vagueness into which his portraits lately have been fading. Then there is M. Dagnan-Bouveret, fairly embarked on the melodrama of paint, appealing to a sentimental public with a sort of "handkerchief box" travesty of the Mona Lisa, as some one has suggested, in a picture he calls "Sur les Cimes." And there is M. Roll, whose endless excursions into the open air have blinded him, even indoors, to all but the crudest, most violent effects, when violence touches close upon vulgarity. And there is M. Picard, who has repeated his trick of illumination, which at one time was not without charm, until evidently he can no longer see either light or color.

So I might go on through the list—even M. Gaston La Touche becoming a slave to his own mannerisms; even M. Simon all too soon condescending to the mere reporting of facts which might comfortably be left to the photographer; while M. Cottet, as if eager to be spared the common fate, as if afraid that he in his turn would be held fast in the toils of the sad, gray Brittany and the tragic peasants he loves, has rushed to the other extreme of brilliancy. There is no mourning, no tragedy, in his large picture of this year. His peasants now feast in an orgy of color, and the group of women who sit eating their dinner on the grass immediately in the foreground of a wide landscape, wear costumes of such vivid hues and have jumped so entirely out of the atmosphere enveloping the rest of the picture, that they fairly hurt your eyes. It is a pleasure to look, instead, whatever M. Cottet may be risking by the repetition, at the smaller, more sombre landscapes that surround the big canvas. How much more beauty there is in the little sweep of barren moorland, with the stretch of sad, gray sea beyond under a low canopy

of thunder cloud! And how wonderfully M. Cottet has rendered the strange leaden grayness that heralds the storm! I know of no one else who has got the same effect so well except Diaz, studying it in the Forest of Fontainebleau. Two or three black, huddled figures scurry across the desolate land in the distance, but how much more truly they belong to the picture than that group of peasants in all their carefully observed and elaborated finery!

Here you have, undoubtedly, some of the most distinguished men just now at work in France—painters for whose pictures you are always sure to look first when you go to their annual exhibition. What it is, then, with the rank and file may easily be imagined. And I think the gradual inertia that has been coming over exhibitors in the New Salon—the inertia which, unwilling as one has hitherto been to admit it, this year reaches a stage beyond denial—is important to note, for it may serve as a clue to the present stagnation in modern art: the stagnation as bewildering to the critics as to the artists themselves. But the artist who bases his work on a formula—whether an academical, or sensational, or eccentric, or decorative, or prismatic, or any other sort of formula—and forgets that beauty is his chief concern, is bound sooner or later, and usually sooner, to come to the end of his resources. It is inevitable.

In the midst of all the glare and glitter of paint, of the sensationalism and eccentricity run to seed, it is curious to come upon a portrait by Whistler, a large full-length, quiet and restrained in treatment, low in tone, and to find how, unfinished though it be, in its repose and dignity it makes a deeper impression than any other picture in the Salon. It might be objected that Whistler, too, had his formula—that to him, as he was quick to say, painting was a science, and could be reduced to a set of propositions for the guidance of his students; that perhaps few painters accepted so deliberately the restrictions of their palette. True; but Whistler's formula—if, for the sake of argument, it is agreed that it can be called a formula—was one to help him in his search for beauty, one to help him to see; it was no mere recipe for turning out pictures after an accepted pattern, or for strengthening him in any pose or affectation or trick. While M. Boldini, whose two portraits by some cruel chance hang on a neighboring wall, was engrossed in his own cleverness; while M. Emil Claus, whose big "M. Camille Lemonnier," by an equally cruel chance, hangs almost opposite, was too busy with his recipe for rendering sunlight to consider its disastrous effect upon his sitter—Whistler had no other thought or object or desire but to find the right expression for the beauty (or the poetry, as he called it) that he knew is the painter's problem. The tall, graceful woman in the rose-violet draperies that give the harmony its name, seems just to have stepped from out the shadowy purple depths beyond as she stands there in her beauty, her right hand extended holding an iris, her little head so well poised above the lovely neck. The picture, as I have said, is unfinished. The neck has been scraped until the canvas shows harsh and black through the warm golden tones of the flesh; the left arm and hand fall, vague and shadowy, among the draperies, and in these draperies here and there are indefinite passages. Those who saw the picture in an earlier stage, when still in his studio, may probably feel something like regret that Whistler did not leave it as it then was. But he, who was never satisfied with anything less than the perfect expression of the perfect beauty haunting him, knew better than any one else what he wanted, what he was seeking; and the real regret is that he did not live to carry the work to the completeness, the perfection, of the "Mother," the "Carlyle," the "White Girl," the "Sarasate." But even so, this is the picture to which one returns again and again with the pleasure all great art should and must inspire. There is also a smaller portrait by Whistler, a study of the nude, and one of his beautiful little notes of color in Dieppe; so that he is well represented, if on a lesser scale than in Boston or Edinburgh, or in fewer of his characteristic phases even than at the last International in London.

One thing that has struck me this year in Paris, and that seems to me a good sign, is the growing influence of Whistler. I do not mean so much that with him you can point to a following of slavish imitators as in the case of Carrière and Monet; or, in the Old Salon, of Bail and any other painter who happens to have made a popular success. But I think that, thanks to him, some of the more promising of the younger generation have been reminded that their business is to see and express beauty, and not to astonish the public by fireworks in paint, or to secure immediate purchasers by excursions into sentiment or the day's fashions. I feel this especially in the work of men like Morrice, Frieseke, Maurer—one a Canadian, the other two American—to whom I remember calling attention last year. Mr. Morrice, whether he is looking down on the Quai des Grands-Augustins in the evening, with the lights shining softly along the river banks and in every window, or over the sea in full daylight, or at the Montmartre fête, when its illuminated booths glow brilliantly through the dark night, always sees the picture before him as a harmonious whole, in which the details of houses and lights, sky and water, are important only for the part they play in the harmony. I am not comparing Mr. Morrice to Mr. Whistler—that would be absurd; it is far too soon in his career even to suggest such a comparison. I only want to point out that it is beauty of color and tone and form that interests him, and that it is Whistler who is gradually forcing the younger men to understand that this beauty alone counts—that fireworks and fashions are as fast-fleeting in art as in actual life.

Mr. Frieseke evidently accepts the same standards, though his subjects are very different, and though his means are slightly too obvious. For instance, probably the best thing he has this year is the smalier of his two nudes: the study of a woman standing before a mirror, with all the accessories arranged in a color scheme that might be charming if, somehow, the effort to produce it were not so obtrusive in the rose of the draperies and the touches of red in the necklace and the half-open fan on the floor—he lets you see too much of the machinery or the method. He has not yet the skill or the subtlety to conceal all traces of the labor by which his end is achieved. Mr. Maurer is more vigorous, and I think more original, and this year he makes a distinct advance. Besides a large full-length figure of a man, recalling the ballet dancer of last summer, he has three or four interiors that are beautiful in their rendering of tone, in their envelope of atmosphere. His "Barber's Shop" ("Chez le Coiffeur") seems to me to explain the new tendency which I find in the younger school. That the average English painter would discover in such a subject nothing but a futile little anecdote, everybody knows. To a French painter like M. Béraud, immensely able in his own way, it might have suggested chiefly the chance to show his amazing mastery of the most minute and unexpected detail. To another, more in sympathy with Monet, it would have been the opportunity for an exercise in blue shadows and dots of pure color. But Mr. Maurer has cared to paint a barber at work simply because, where he stands at the far end of his shop, he draws the eye serenely into the cool, gray interior, his form and action just giving the right value, the right solidity and color, to the space where the effect should be concentrated. For to the artist who can see and feel color and light and atmosphere, a barber's shop may be as splendid as a palace.

I mention these three men, though there are others whose work reveals the same influence, because they are the most notable of the group. But, for that matter, in the Old Salon, too, there are traces of this influence. Now and then a quiet portrait, low in tone, dignified in treatment, caught my eye from out the tawdry, gaudy medley: imitation here more unmistakable than in the work at the New Salon, to which I have referred. But to imitate the right models is to learn much in the process. I thought it promising that these portraits should be mostly by Americans, men like Mr. Gaensslen and Mr. Lee Greene Richards, whose names, I must confess, are new to me.

Of course, I do not pretend that all interest in the two Salons begins and ends with Whistler and his influence, though to say so would not be very far from the truth. But in both there are still a few of the older men who have been able to resist the vulgarizing forces of the moment. The landscapes of M. Pointelin and M. Harpignies in the Old Salon retain their distinction, despite the fact that neither of these artists of late years has varied the matter or manner of his composition—it is not only landscape, but actually the identical landscape, each seems to keep on painting. And so M. Carrière, in the New Salon, loses himself and his subjects—portraits, this year—in the mists through which he now sees everything, though there is no mistaking that he does so in all sincerity, not for the sake of notoriety. M. Lhermitte, too, is rather apt, year after year, to wander in the same fields and by the same river banks, but his landscapes are so sound and straightforward and workmanlike that they always hold their own in any assemblage of self-conscious, contorted out-of-doorisms. Again, in both Salons there are Spaniards among the younger men who send work with something like individuality. In the Old Salon it is Sorolla y Bastida, who looks at things, if not with much refinement, at least with freshness and ro-

bustness, and whose children in full sunlight playing by the sea, and a fisherman's family in their poor hut of a home, are painted with a knowledge and a vigor that prove he really saw them for himself. In the New Salon it is Garrido, who, I am glad to say, is as good as he was disappointing last year, his old-masterly study of two children being full of life and character. And it is also Anglada, who, surely, with the emotional sense of color that is strong in him, must in the end attain to the beauty he now gropes after in his gardens and cafés at night, where the lights flame and flare and flicker with tormented violence from out the shadows, and strange, fantastic, twisted figures pose and pass in garments of burning or smouldering color. Distorted as his vision seems to be, his work has in it a quality that makes one look forward anxiously to his eventual development. Zuloaga, however, sends nothing, probably reserving himself for his special show at Düsseldorf.

There is a big ceiling by M. Anquetin, the story of Rinaldo and Armida its motive, which here seems so forced and flamboyant in its Rubensesque color and design that I should like to see it in its proper place before deciding upon its merits. There are some good portraits by M. Blanche, notably one of M. Maurice Barrès. And there is Mr. Sargent's "Lord Ribblesdale," which I described when it was first shown at the Academy. It is one of his most successful portraits, and loses nothing in dignity and sobriety by being seen in the present salon. But where is Mr. Alexander? Where are Mr. Melchers, Mr. Dannat, Mr. Humphreys-Johnston? Mr. Gay is here with several of his carefully observed little interiors, while Mr. Hitchcock and Mr. MacEwen continue faithful to the Old Salon, where Mr. MacMonnies's big portrait of a priest in sacred vestments is far from reconciling me to his prolonged absence from the Sculpture Court. For the rest, it is enough to say that in the New Salon painters like Le Sidaner, Lepère, Thaulow, Baertson, Conder, Ménard, continue to send pictures of charm or character; that Louis Legrand's intense cleverness in his studies of ballet girls and women of a doubtful class does not always steer him safely away from the pitfall of vulgarity; and that the first appearance of Besnard's son, Robert Besnard, with a large, ambitious picture of a supper party—a problem of light—may be, at all events, worth recording.

In the Sculpture Court M. Rodin's "Penseur" towers, as it did at the International last winter in London, the only difference being that now it is seen in bronze. I need not repeat what I have written about it so lately. It is one of M. Rodin's great creations, and it towers so effectually that I really saw little else except M. Meunier's big miner in bronze, while I could only regret the absence of M. Bartholomé and Mr. Saint-Gaudens. The drawings and prints are not as remarkable as they have often been of recent years. The work of M. Milcendeau, M. Luigini, and M. Legrand still is the exception in the heterogeneous pastels and water-colors of the New Salon; M. Renouard has an exhibition to himself; and there is hardly anything of particular interest among the lithographs and etchings—even Louis Legrand showing nothing to compare with those beautiful plates of last year. In the Old Salon there are etchings of London by Mr. Pennell, wood engravings by Mr. Wolf, notably one after Whistler, lithographs by M. Dillon, and walls covered with reproductive prints and commonplace. The New Salon is devoting an ever-increasing space to the decorative arts. It is impossible for me to speak of the innumerable examples in detail; of the collection as a whole, I can only say that, to my sorrow, I found through it all the trail of "L'Art Nouveau." N. N.

Correspondence.

JŪ-JUTSU.

To the Editor of The Nation:

Sir: In the *Nation* for February 18 your reviewer of H. Irving Hancock's 'Japanese Physical Training' would seem to do a great injustice to Lafcadio Hearn. Mr. Hearn, it is true, has little to say of the jū-jutsu of the schools, but still, after his chapter on the subject in 'Out of the East,' which appeared in 1896, it seems hardly fair to say: "The very existence of this system of physical culture [jū-jutsu] . . . has until recently been unnoticed—indeed, hardly suspected—even by foreigners long resident in the country."

Professor Chamberlain, too, might find something to complain of in the review in question. To quote again: "Jū-jutsu is not even referred to in Chamberlain's 'Things Japanese.'" Notwithstanding, I find, on referring to my copy of 'Things Japanese' (third edition, London, 1898), that "jū-jutsu" occurs in its proper place in the index, and is described on page 439, under the head of "wrestling." It is difficult to see how the reviewer could have missed the article.

But the unfortunate fact about your review is, after all, that it leaves one still uniformed as to what jū-jutsu really is; and this is most regrettable in view of the significance of the art as an index to Oriental character and policy. This significance has been by no one better understood, I think, than by Mr. Hearn. In the chapter on "Jū-jutsu" in 'Out of the East' he says: "The master of ju-jutsu never relies upon his own strength. . . . The force of the enemy is the only means by which that enemy is overcome. . . . The very name 'jū-jutsu' means *to conquer by yielding*." And then again:

"In jū-jutsu there is a sort of counter for every twist, wrench, pull, push, or bend: only, the jū-jutsu expert does not oppose such movements. No: he yields to them. But he does much more than yield to them. He aids them with a wicked sleight that causes the assailant to put out his own shoulder, to fracture his own arm, or, in a desperate case, even to break his own neck or back."

Mr. Hearn professes to know nothing of the technicalities of the art. It is the greater jū-jutsu with which he is chiefly concerned:

"The real wonder of jū-jutsu is not in the highest possible skill of its best professor, but in the uniquely Oriental idea which the whole art expresses. What Western brain could have elaborated this strange teaching—never to oppose force to force, but only to direct and utilize the power of attack; to overthrow the enemy solely by his own strength; to vanquish him solely by his own effort? Surely none! . . . Yet how fine a symbolism of Intelligence as a means to foil brute force! Much more than a science is this jū-jutsu: it is a philosophical system; it is an economical system; it is an ethical system; . . . and it is, above all, the expression of a racial genius as yet but faintly perceived by those Powers who dream of further aggrandizement in the East."

The author then proceeds to develop his thesis, finding in the principles underlying jū-jutsu the secret of the power of the Orient—of China as well as of Japan, for the art of jū-jutsu, he reminds us, came from China to Japan. The whole chapter is most illuminating. It should be translated into Russian. "The very name 'jū-jutsu' means *to conquer by yielding*."

Before concluding, may one return for a moment to the reviewer? "Jū-jutsu," he says, "which is a Sinico-Japanese term, means literally muscle-science." Now the Chinese ideograph for "jutsu" may indeed be rendered "art," or "science"; but, according to Giles, "jū" (in Chinese, as usually transliterated, jou2) means "soft," "pliant," "yielding." This would seem to suggest a translation of the term which would be fully in accord with the description of the art given by Mr. Hearn.

I have the honor to be, sir,

Very truly yours,

David Lattimore.

Nauyang College, Shanghai, April 22, 1904.

[The first and second editions of Chamberlain's 'Things Japanese,' used by the reviewer, contain no reference to jū-jutsu. It was not within the scope of a review of Mr. Hancock's practical work to inform all who were eager to know "what jū-jutsu really is," certainly not in the highly philosophical subjective and impressionistic style of Mr. Hearn. Mr. Hancock's excellent manuals deal with fact and method, not with philosophy. To get the meaning "conquer by yielding" out of the literal term, is scholasticism, not true translation. Jutsu is a common term in Japanese for a science, and jū for muscle. The Japanese synonym for jū (*yawara*), as well as the Chinese ideograph, means "gentle," "mild," and jū-jutsu is the gentle science (or art) as being weaponless, and opposed to the rough exercises, such as fencing, horsemanship, etc. In common parlance—coming down from pre-scientific days—the term *jūtsu* means craft, sleight, trickery. The reviewer gave the literal meaning, not its metaphysical refinement. Without venturing into the domain of psychology or international diplomacy, or attempting to guess "the secret of the power of the Orient—of China as well as of Japan," perhaps the remarks of Dr. Inazo Nitobe, in 'Bushido, the Soul of Japan,' may be worth transcribing:

"Jiujutsu may be briefly described as an application of anatomical knowledge to the purpose of offence or defence. It differs from wrestling in that it does not depend upon muscular strength. It differs from other forms of attack in that it uses no weapon. Its feat consists in clutching or striking such part of an enemy's body as will make him numb and incapable of resistance. Its object is not to kill, but to incapacitate one for action for the time being."—Ed. Nation.]

Notes.

Houghton, Mifflin & Co. announce that Walt Whitman's Life in their American Men of Letters series will be written by Bliss Perry, Dr. Holmes's by Samuel M. Crowell, and Lowell's by Ferris Greenslet; as, in their American Commonwealths series, Massachusetts will fall to Prof. Edward Channing, and Rhode Island to Irving B. Richman.

The Macmillan Co. have just ready the fifth volume of Brandes's "Main Currents in 19th Century Literature," 'The Romantic School in France.'

'Favorite Greek Myths' has been prepared for children by Lilian Stoughton Hyde, and will be published, with illustrations from masterpieces of sculpture and painting, by D. C. Heath & Co., Boston.

Western school-children of the fourth and fifth grades were in 1891 provided by Dr. Charles A. McMurray with two volumes of "Pioneer History Volumes," relating to their particular section, viz., 'Pioneers of the Rocky Mountains and the West' (beginning with Lewis and Clark) and 'Pioneers of the Mississippi Valley.' These reading-books have now been taken over by Macmillan Co., and accompanied by a third, chronologically antecedent volume, 'Pioneers on Land and Sea,' in which, as in No. 2, the arrangement does not follow the time sequence, because, as the author says, it is "of little consequence to the children." But this is more than doubtful. He advises setting up "the home State as a starting point," and then moving eastward from this centre. There are maps, portraits, and other cuts of good quality.

The prettily illustrated little collection of nine 'Folk-Tales from the Russian,' retold by Verra Klamatiano de Blumenthal (Rand, McNally & Co.), is well fitted to serve as an introduction to a new realm of fairy tales for the little people who still enjoy such things. Older students of national lore will prefer to consult the same stories as found in three extremely fine and more raciiy characteristic collections, namely, 'Russian Fairy Tales,' from the Skazki of Polevoi, translated by R. Nisbet Bain; 'Russian Folk Tales,' by W. R. S. Ralston; and 'Myths and Folk Tales of the Russians, Western Slavs, and Magyars,' by Jeremiah Curtin.

'Stories from Irish History,' told for children by Mrs. Stephen Gwynn (Dublin: Browne & Nolan), is the best book of the kind that has yet appeared, neither fiercely anti-English nor sectionally religious. The illustrations are strikingly effective—the first, St. Patrick, in by no means ecclesiastical habiliments, preaching; the last, a view of the insurgent camp on Vinegar Hill. It concludes with a paragraph on O'Connell's death and the Famine. "This is more than fifty years ago, and the story of what has happened since would be rather difficult for you yet. It is all concerned with Parliament and with laws. It will interest you some day, and then you will hear of Parnell and the Home Rule Bill, and about the work of the Gaelic League."

Two additional volumes of the reprint of Arber's "English Garner" (E. P. Dutton & Co.) have reached us, containing the "Elizabethan Poems." These are something more than mere reprints, as a considerable quantity of new material has been added by the editor, Mr. T. Seccombe, as well as excellent introductions by Mr. A. H. Bullen.

The war in the East could hardly fail to prompt a reissue of the translation of Alfred Rambaud's comprehensive and enlightening sketch of 'The Expansion of Russia' (New York: Scott-Thaw). His theme is the Slav's unceasing effort to reach the open sea; and, coming down to 1895, he points the parallel between the European Concert that cost Japan "the most precious fruits of her success against the Chinese, just as the Russian conquerors of the Ottomans [in 1878] had lost theirs." The latter half of this little volume is occupied by a psychological study of the Russian people, by J. Novikoff of Odessa. This writer wrote at a time when Russia appeared to be "without aspiration, and with no ideal of any kind." The circular of August 24, 1898, which led to The Hague Conference, seemed a ray of light; but "Russia has also experienced a recrudescence in naval affairs, a more foolish madness even than militarism."

Seasonable in quite another way is the popular edition of the late Celia Thaxter's 'An Island Garden,' first put forth by Houghton, Mifflin & Co. ten years ago. The author's portrait is retained, but the expensive colored lithographic illustrations have been omitted, and both the form and typography have been modified in favor of the buyer's pocket.

Miss Gertrude Jekyll's books on gardening, derived from her experiences in a beautiful garden in the southwest corner of Surrey, are well known to the amateur gardener. By making a plot of her native land a place of beauty, Miss Jekyll deserved well of her county. In her 'Old West Surrey' (Longmans) she does it further service. Surrey is one of the prettiest counties in England, but it lies at the very door of London, and becomes every year more suburban. Its customs change. The farms exist to supply villas, or are converted into country retreats for Londoners. The cottages are ransacked by dealers in antiquities, and the solid old oak furniture is rapidly giving place to cheap deal. The china that had served generations is placed in drawing-room cabinets, and inferior shapes and designs make their way into the cottages. With these depressing facts in mind, Miss Jekyll has done for the west of Surrey what should be done for every English county. She has collected in this book a great number of photographs of the old furniture, the ornaments, the crockery, and tools—in fact, all the minor appointments of cottage life that threaten to become minor antiquities. From rushlights to oak presses, nothing has escaped her camera. The result is really an illustrated catalogue, with a running commentary, the sort of work that will, a century or so hence, save such a writer as Mrs. Morse Earle a great deal of trouble when she adds the history and the anecdotes that make a readable whole. Meanwhile, many of the articles photographed by Miss Jekyll are still in very general use in the country districts of England, though they may not be produced nowadays as they were fifty years ago. Many could be duplicated in American households that have colonial antecedents. Miss Jekyll evidently fears that, along with the picturesque cottages and furniture of good design, the inhabitants will degenerate. She includes, therefore, several charming types of Surrey cottagers, of a pattern that will hardly be repeated. These were perforce chosen from among the very old, the younger generation being, no doubt, vulgarized by the progress of civilization out of any pretence to the picturesque. The relation of the text to the illustrations may be estimated from the fact that the latter amount to 330 in the 315 pages of the volume.

Mr. Gordon Home's 'Yorkshire' (London: A. & C. Black; New York: Macmillan) is hardly a guide-book so much as a record in color of the author's wanderings in the northeast parts of that shire. The text, though interesting, is unimportant, serving merely as a frame for the thirty-two full-page sketches, which are beautiful in coloring, and, like all in this luxurious series, admirably reproduced. For the antiquarian Yorkshire offers but scanty attractions; it has singularly few churches that repay attention, and its architecture falls far behind that of most other counties. But it is rich in the irresistible combination of heather-covered moorland and sea; its cottages are red-roofed (an important point in the gray English landscape); and, bleak as it is by reputation, it has some beautiful woods and gorges. Mr. Home's pictures are in some cases so intense in color as to suggest the coast of the Mediterranean rather than the northeast of England.

Macmillan Co. issue George W. Beldam's 'Great Golfers,' illustrated by 268 action-photographs, and containing contributions by Taylor, Vardon, and other golfers. One would have thought that the last word had been written that could be of assistance to the young golfer, but the present volume contains two novelties which seem to be both interesting and useful. In the first place, the players whose strokes are reproduced were not taken *en pose*, but in the act of making actual strokes; and, with a view to absolute accuracy in the matter of the stance, they stood on a marked square of four feet subdivided into smaller squares of six inches. By this means the beginner gets an excellent idea of the importance of the stance, and of the slight differences between players caused by different length of limb, etc. Moreover, Mr. Beldam's photographs were taken in the 1-1000th part of a second, and therefore present a more accurate picture of the different parts of the stroke than has ever been obtained before; and the interesting fact revealed by this more rapid process is that, in spite of some individual peculiarities, the strokes of the best players are practically identical. It is fair to assume that this similarity is due to more or less conscious imitation; and, if so, Mr. Beldam's book needs no further justification.

If so many books on the famine in India had not already been published, J. E. Scott's 'In Famine Land' (Harper & Bros.) would deserve a more extended notice. It is a succession of horrible and pathetic scenes in word and photograph. The author is, or was, chairman of the M. E. Relief Committee in Rajputana, and the special value of his personal narrative lies in its being an account of the distress and horrors found not under British but under native rule. The little book is to be praised

for its grasp of the situation. In the author's words, "Divine Providence" and not the British *raj* is responsible for the lack of rain which has caused periodic famines in India since the earliest times. But man must adjust himself to circumstances. If God sends a drought eight times a century, man must save up his grain to meet it and prevent it as far as possible by more irrigation and better means of transport. Meantime, since prevention in the present case is impossible, the only cure remaining is to support the "ten thousand famine-stricken, mostly children and widows." Ten thousand is a phrase; sixty millions of people were affected by the famine, and five millions are to-day in need of the food of life. What would otherwise have gone to their relief from England was spent in defeating the Boers in Africa.

The blank book 'My Commencement' (Dodd, Mead & Co.) has been devised as a sort of autograph and photograph album and scrapbook, having special reference to the teachers, classmates, and closing exercises, with statistical items and with pages for reunions. The size of the volume is duodecimo, and the general appearance is neat. Some guards should have been bound in to allow for the expansion of clippings and other pasted matter.

We can but infrequently make mention even of the most meritorious sale catalogues, which often constitute real bibliographical thesauri. Such are Jacques Rosenthal's 'Bibliotheca Magica et Pneumatica' (Munich, 10 Karl-Strasse), of which the index alone, in triple columns of fine type, requires nearly fifty octavo pages. The catalogue is classified, and the running titles and table of contents are in French, German, and English. The scope of this collection of 8,875 pieces far exceeds the implication of the title or sub-title ("Occult Sciences: Folk-lore"). From the same antiquarian firm we have a noteworthy catalogue of 'Incunabula Typographica,' with marks, colophons, and plates in facsimile, and tables according to places of imprint and name of publisher, as well as in comparison with Hain. A third catalogue is of 'Book Illustration in the Middle Ages,' likewise curiously exemplified.

The modest birthplace of the late Maria Mitchell, Nantucket's astronomer, was purchased year before last by the Maria Mitchell Association of that island, and opened last July to the public as a museum, with a small admission fee. Besides a room devoted to personal mementoes, there is another arranged as a reading-room and library for scientific books, and hung with portraits of men of science; a third will contain a collection of objects of natural history. Donations will be gladly accepted, and membership in the association is open to every one friendly to the enterprise, the fee being one dollar annually or five dollars for life.

As Rousseau's double centenary draws nigh, attention is freshly drawn to him by the effort which the municipality of Chambéry is making to purchase "Les Charmettes" for a Rousseau museum, which will be the other pole of that just established at Geneva. The charming and forever memorable estate, which has been maintained essentially intact by the successors of Mme. de Warens, as if a public trust, can be had for $10,000, of which the town can provide $4,000, and hardly more. It therefore intends to ask a subvention from the State, in order that the place may be classed and cared for among France's "historic monuments"; and indeed few are objects of a more ceaseless pilgrimage. M. Henri Bordeaux, writing in a late number of *Figaro*, enumerates among recent visitors whose names appear upon the register of Les Charmettes Maurice Barrès, Édouard Rod, and André Hallays, who (he apprehends) cannot help liking and detesting Rousseau at the same time.

—The Wisconsin State Historical Society has just taken the first step in a new departure which may be unique and is certainly a rarity. It has reprinted the first volume of its Historical Collections, and will add to it the next nine volumes of the first series. This republication results from the recognized value of these collections to all writers on the history of the Middle Northwest, and the consequent demand for them, which had long ago made these books scarce. The first of the decade was published in 1855, the last in 1888. The pages in one were 164 to 558 in the other. Francis Parkman showed his regard for the infant society by contributing to the first volume a transcript of the earliest original manuscript respecting Wisconsin under English rule, of which he was the fortunate owner. These renewed volumes cover thirty years and more, during which the institution grew from nothing to preëminence above all Western associations of its class, thanks mainly to the labors and inspiration of the late Lyman C. Draper, whose biography is fitly prefixed to the first volume of the reprint. The fifty volumes which Draper found in a glass-doored cupboard of three shelves, as the total gathered in five years of previous growth, he increased by a thousand within the first year of his service, which was without hope (or wish, either) of receiving himself any fraction of the $500 which was given by the State. When resigning his secretaryship in 1888, he reported "118,000 books, newspaper-files, and pamphlets—a collection unequalled west of the Alleghenies."

—The reprint, which will be of two thousand copies, is a page-for-page facsimile of the original imprints, so far as types allow, in pagination and other features, with no corrections save such as a good proof-reader would have made from the first. This plan was adopted partly that references which have already been made to the series by hundreds of writers may be traceable, and the general index to the whole may do its perfect work; but chiefly because recasting the old matter would impair the fitting historic impressions which ought to be made permanent. The more the faults of the documents are left on their own heads, the more we can read between the lines and see how—and how much—research has since added to early knowledge. The Society has an annual appropriation from the State of $20,000, and obtains something from membership fees. It has also several funds of which only the interest is available, and not all of that for a time. The binding fund amounts to $27,802, the antiquarian fund to $5,574, the Draper fund (his all) to $8,525, and the Mary M. Adams art fund to $4,297. The present strength of the library is estimated to be: books, 126,567; pamphlets, 121,473. It needs shelf-room for expansion more than the United States has ever needed territory.

—It is more usual to abridge a long historical work than to publish one whole section of it as a separate volume, unaltered save by being wrested from its context. In a good many cases, however, this form of popularization might be resorted to with advantage. The fiftieth and fifty-first chapters of Gibbon, or the third chapter of Macaulay, would suffer little by separation from their setting, and so it is with the three chapters which Lecky devoted to the French Revolution in his 'History of England during the Eighteenth Century.' This portion of Lecky's *opus* has recently been edited by Prof. H. E. Bourne (Appletons), with such notes as bring to the reader's attention the researches of Sorel, Aulard, and Gomel. A book of nearly 600 pages is made up in this way, and it is one which bears with equal directness upon the French Revolution and English politics. To Lecky, as an historian of England, the Revolution was a force which broke in upon the old rivalry of Whig and Tory, and, politically speaking, brought the eighteenth century to an end. Hence, though a movement of foreign origin, it lay athwart his path, and had to be disposed of. His own philosophical cast of mind led him to welcome the opportunity of discussing such a subject. Few themes among all those which he dealt with in the long course of his writings can have interested him more than the character and effect of Burke's 'Reflections.' Nor did he slight the diplomatic questions which became so increasingly important during the days of the Constituent Assembly. As Professor Bourne points out in his Introduction: "Lecky interprets the early and most significant period of the Revolution." His aim is interpretation rather than research or purely literary effect. Altogether, his comments upon the revolutionary movement in itself and in its relation to England are quite valuable enough to justify the publication of these chapters in separate form.

—Mr. Richard Le Gallienne's 'How to Get the Best Out of Books' (The Baker & Taylor Co.) is addressed to "the natural man," defined more closely as "the business man." If we may judge from the price of this slim volume, which is high, and the fact that it takes for granted the desire to found a library, if not to read the books in it, it is the unread millionaire who is to be lured into the society of the standard authors by "these simple pages." To convince such a one that "literature is a living thing, and that the relation of books to life is close and vital," is perhaps not so simple as Mr. Le Gallienne seems to think. With a light heart he proposes that his "natural man" shall read himself to sleep, shall get up early to read, shall fix his mind on a book as he travels down town in the Elevated, acquiring culture as Horace's Lucilius wrote poetry, *stans pede in uno*. He begins with a utilitarian argument to the American Dives, pointing out "how much modern Imperialism owes to Mr. Kipling, and that the most successful advertisements have been in verse." What a nemesis on the frivolity of Byron that the illiterate rich

should be persuaded to read 'Don Juan' on the ground that the couplet,

> "In virtues nothing earthly could surpass her
> Save thine incomparable oil, Macassar!"

has sold countless bottles of Rowland's Macassar oil! Mr. Le Gallienne assures the builders of the Flatiron that they are the music-makers of their century, and really ought to read the poets since they involuntarily serve poetry—how, he does not explain. A more practical appeal to the frugal millionaire is the reminder that the poets can usually be obtained in one volume; and where it is a matter of several volumes, you can now furnish your library like your drawing-room on the installment (*sic*) plan. The unpractised rich are advised to begin with the novel; when merely romantic, it may lead them to poetry; the philosophical novel inspires one with a desire to read Spinoza "in an easily accessible handbook," while the historical novel will engender a taste for Froude, whom Mr. Le Gallienne does not apparently class among the writers of fiction. Incidentally he diverges into literary criticism, speaks of the "rainbow volubility of Coleridge," calls Mrs. Atherton a philosopher and a poet, and prophesies that Mr. Howells, on the strength of style, will outlast Mr. Henry James, whom he seems to regard as a sort of Aristotle among modern novelists.

—Messrs. Luzac & Co. have made a happy beginning to their "Oriental Religious Series" with a translation of De Boer's 'Geschichte der Philosophie im Islam.' The original appeared in 1901, and could claim very fairly to be the first attempt at an outline of the whole history of philosophy in Islam since the admirable 'Mélanges' of Munk in 1859. Since then there have been two or three other books on the same subject, and the promise is of still more. It is evident that Arabic studies are passing at last the grammar and lexicon stage, and that the civilization of Islam in all its width is to be considered. Such books, then, as De Boer's—simple, straightforward sketches, intelligible to any student of the subject, Arabist or not—are of the first value. For what is needed now is not so much further work by Arabists in the narrow sense, but an awakening by students of philosophy, theology, human life, and thought generally to the fact that there is a great section of history, hitherto neglected, but absolutely necessary to the understanding of the development of the human race. The time is rapidly coming when the student of mediæval Europe will find it necessary to be in contact with the mediæval Muslim East, either by collaboration with an Arabist or by learning Arabic himself. After a long eclipse behind the grotesqueries of Indian so-called philosophy and religion, Dr. Johnson's large dictum is coming to its own again, and the world of Islam is recognized as a legitimate object for an intelligent curiosity. The time for criticism of De Boer's little book has almost gone by. It has taken its place as an indispensable introduction, recognizing rather too little, perhaps, the unity of all thought, philosophical and theological, and the essentially mystical bias of all Muslim thought, but wholly admirable in its clarity and grasp. The present translation, by Mr. E. R. Jones ('History of Philosophy in Islam'), is a fair rendering, showing more knowledge of philosophy than of Arabic or German. *Darstellung* is an unchancy word, but by no possibility could "der Darstellung wegen" mean "conforming to the conditions which I had to meet"; "soll" and "sollte," also, these stumbling-blocks to the book-taught Germaner, which are so simple to a speaker of the language, have thrown Mr. Jones more than once; "school" is hardly "Bildungskreise," nor has "ging man bei Christen in die Schule" necessarily to do with "school-instruction"; "circumstance" is not "Ereigniss," nor is "able" a fair rendering of "klug"; "Güter" are not "benefits"; "Wortkunstelei" is not "sophistry," and "Im Osten" is certainly not "on the East." These, and more, are to be found in the first five or six pages, and so much space is given to them here as a running protest against such slackness.

—Another sign of how the ends of the world are coming together is furnished by an introduction writen by Professor Goldziher of Budapest for the edition of the works of the Muwahhid Mahdi, Ibn Tumart, just published at Algiers ('Mohammed Ibn Toumert et la théologie de l'Islam dans le Nord de l'Afrique au xie siècle'). From this it seems a far cry to our philosophic conflicts, but the comment may be ventured that in this brochure the first step is taken to an historical appreciation of Averroes and the possibilities of the times which produced him. We could already, it is true, trace in De Boer his philosophical descent, but his environment was shadowy and uncertain. Especially was it hard to see how he could have lived and spoken as he did. Now that is clearing up, and the possibilities of life under the successors of Ibn Tumart were evidently large—larger than Siger of Brabant found Christian possibilities to be.

MISS HARRISON'S CORNER OF GREEK RELIGION.

Prolegomena to the Study of Greek Religion. By Jane Ellen Harrison, Hon. D.Litt. (Durham); Hon. LL.D. (Aberdeen); Fellow and Lecturer of Newnham College. Cambridge (Eng.) University Press; New York: Macmillan. 1903.

Miss Harrison's really remarkable book on Greek religion does not professedly take up more than certain of its neglected aspects—those, evidently, which lead on to the four closing chapters (IX.-XII.) upon Orphism and Orpheus. This dim and subterranean phase of Greek and Greco-Roman religion occupies one-third of her 670-odd pages. The first eight chapters give a restatement of many things—notably of what concerns the lower stratum of primitive religion and ritual, unrecorded in Homer, but much dwelt on by Rohde in his 'Psyche.' Miss Harrison never loses sight of her problem, stated as follows (p. 455): "Mythology has left us no tangle more intricate and assuredly no problem half so interesting as the relation between the ritual and mythology of Orpheus and Dionysos." Immediately before, she summarizes and foreshadows her solution in eloquent words, the drift of which may be thus baldly stated: Some temperaments cannot take bread and wine seriously, or feel "the sacramental mystery of life and nutrition." These have little power of understanding "the constant shift from physical to spiritual" that is of the essence of the religion of Dionysos. Others, "saintly souls," know the "exhilaration of wine," and what it is "to be drunken with the physical beauty of a flower," with the "sensuous imagery of words," with the "strong wine of a new idea," yet, having known, turn away, "disallowing the madness, not only of Bromios, but of the Muses and Aphrodite." Such have their inward ecstasy of the ascetic, but they revel with another Lord, and he is Orpheus (pp. 453 f.).

Orphism, briefly treated in his recent History of Greece by Professor Bury as a spiritual peril against which Ionic philosophy was a providential prophylactic, has not been deemed worthy by Rohde of a very minute or sustained investigation, while Gruppe's very complete sketch of it in Roscher's Lexicon, though admirable and painstaking, is written as it were in shorthand, and could never appeal to a wide circle of readers. Hence Miss Harrison's chapters on the subject are most opportune, although few will quite agree with her that Orphism is the last and noblest word of Greek religion. It may, indeed, safely be predicted that these four chapters will be valued rather for their enthusiasm and readableness than for the solidity of all their conclusions. To begin with her treatment of the early fathers of the Christian Church, our authoress trusts them too much and too little. She is often too ready to accept this and that detail upon the strength of their testimony, and yet she is always ready to castigate their "libellous" attitude. It would have been a better way if, remembering the fierce struggle against all manner of pagan rituals which engaged their energies, our authoress had refused to trust them at all as to details when their authority lacked other corroboration. As it is, she accepts too readily many of their facts, while she almost invariably refuses to accept their interpretation of facts. When St. Jerome complains of traditional practices unsanctioned by Holy Writ, he is twitted with his protestantism, and has to hear that these practices were "wisely and beautifully followed" and "can only have come from pagan sources" (p. 597). Little satisfaction is thus vouchsafed him, nor is a more generous allowance made for the historical position of Clement of Alexandria. When he scorns the ritual eating of raw flesh and the myth of Bacchus's dismemberment by Titans, he is convicted of "unholy joy" at the very moment when he "compels our reluctant sympathy" (p. 484). Miss Harrison is rather prone to forget that her own satisfaction in the survival of primitive savage rites could not have been shared by Jerome and Clement, even if their function in life had not been to strike out against Orphism.

How much she believes the Christian Church, in spite of the "unclean interpretations" of Clement and others, took over from Orphic ritual, may be noted in many scattered passages, bearing out her *obiter dictum* (p. 505) that the "early Christians derived from Orphism some of their noblest instincts." Cases in point are (1) the "beautiful ceremonial of the Roman Church" known as taking the veil (p. 523), and (2) the Orphic practice of assuming at final initiation a new name, commended (p. 594) as "a beautiful custom still preserved in the Roman Church" (3) the connection pointed out (pp. 533 and 621) between Orphic ritual and the fact that to the Roman

Church "marriage is a sacrament, to the Anglican" still "an excellent mystery." How far these interesting parallels can stand the scrutiny of liturgical experts may not here be discussed; in Miss Harrison's argument, they at least serve the useful purpose of constantly recalling to the reader's mind that the topic in hand is really and truly religion. Parallels from still living religion, though apt, unless managed with extreme tact, to give pain to the religious, and sure to provoke the ire of the austerely scientific reader, are nevertheless indispensable in every account of an extinct religion intended for a wide circle of readers. For this reason our author is well inspired in saying, apropos of Demeter, that "the Romish Church, with her wider humanity, includes indeed the figure of the Mother who is both Mother and Maid, but she is still in some sense subordinate to the Father and the Son" (p. 261). Even the most evangelically minded may well be glad of this passage as a flashlight flung from living religion upon the elusive records of a worship that has died. A similar illuminating effect is again produced where we read: "It is only the *truth* and the true gods that lived. The Panaghia has taken to herself all that was real in ancient faith, in her are still incarnate the Mother and the Maid, and Asklepios the Saviour" (p. 344).

So far everything is admirable, though there be something of overstatement in favor of the Panaghia; but the reader may be forgiven who should wonder if Miss Harrison has not herself in certain passages fallen a victim to her own excellent devices for vivifying a difficult theme. She notes, for instance, when ingeniously representing the problematical ὅσιοι as priests of the immigrant cult of Dionysus, a connection between the still customary grace at meat, "Sanctify these creatures to thy use, and us to thy service"; and ancient curse-formularies, where "the cursing worshipper prays that the things tabued to his enemy may be to him ὅσια καὶ ἐλευθερα" (p. 504). She then discerns in this primitive tabu, as "mysticized" (apparently) and "spiritualized" by Orphism, "the ritual forecast of a higher guerdon": "Ye shall know the truth, and the truth shall make you free." Nothing but darkness visible results from thus projecting the mysticism of Johannine Christianity into the backward and abysm of savage tabu, or from the juxtaposition of a simple-hearted domestic custom and form of words—presumably of quite recent origin—and the imprecations extorted by fear and wrath from worshippers of nether-world divinities. But no doubt we are not intended to take all this too solemnly. Miss Harrison herself has, in fact, genially supplied the needed corrective in her airy remarks upon the Athenian Thesmophoria. It is "pleasant" to remember, she astutely observes (p. 145), "amid the decay of so much that is primitive and robust," that in the Commination service of "our own Anglican Church, with its string of holy curses annually recited, 'They keep the Thesmophoria as they always used to do.'" Again, our author, who cannot be ignorant of existing difficulties centring around the question of uniformity in ritual, ironically contrasts modern dogmatic theologians with the Greeks, who "in their greater wisdom" saw that "uniformity in ritual was desirable and possible," while they left a man "practically free" in the only sphere in which freedom "is of real importance, *i. e.*, in the matter of thought," Miss Harrison then proceeds to express a far more qualified admiration for those clauses in "our own creed" which are governed by the dogmatic *Credo* than for the solitary clause concerning baptism and the remission of sins, which is under the regimen of *Confiteor*. This clause has, she thinks, "traces of the more ancient conception of the avowal of ritual acts performed" (p. 156). Similar to this acknowledgment of one baptism are, to the thinking of our authoress, those Orphic confessions of ritual acts performed that have been deciphered on the two gold tablets of Compagno. Their complete text, she tells us, is "the expression of a faith so high that it may be questioned whether any faith ancient or modern has ever overpassed it" (p. 587).

In the above pronouncement Miss Harrison exhibits the courage of convictions rather more extreme than those expressed in the fifth sentence of her Introduction, which declares that "what a people *does*" in relation to its gods is "one clue, perhaps the safest, to what it *thinks*." Indeed, her tendency to look upon ritual as an almost infallible guide is illustrated by many passages, notably where she dwells upon that Bacchic madness which is based, not only upon a "definite" faith, but upon a faith which is "the utterance of a definite ritual" (p. 434). "Utterance," here metaphorically used, probably conveys the meaning attached to it elsewhere in a remarkable phrase descriptive of Athena—"the proud rationalism of Athens, uttering itself in a goddess who embodied Reason" (p. 649). If it were not for her insistence upon the adjective *definite* in connection with Bacchic madness, the most general statement of Miss Harrison's ground for choosing to emphasize ritual might be found where we read; "Until the coming of art and literature, and to some extent after, the formulary of theology, is, 'All things are in flux (πάντα ῥεῖ)'"; (p. 604). At all events, Miss Harrison puts her repeated criticisms of the Olympians upon this broad ground; for, immediately after the above characterization of theology, she answers, with an admiring affirmative, Maeterlinck's "décadent" challenge: "La clarté parfaite n'est-elle pas d'ordinaire le signe de la lassitude des idées?" This same view must also account for her objection to the "insistent Greek habit of impersonation" (p. 215), and for her rejection of anthropomorphism as "a clear religious gain." She rather deplores in it "the loss of the element of formless, monstrous mystery." Homer's Olympians are accordingly dismissed from her field of study, now because "they are law-abiding gods, rational, human," instead of being, what Miss Harrison requires, "vague, irrational, mainly malevolent δαίμονες" (p. 7); now because of the "vividness and the clear-cut outlines" of their personalities (p. 164); again, because they are "the splendid phantoms of an imagined Olympic pageant," instead of being, like Persephone and her daughter, "real, earth-born, flesh-and-blood creatures" (p. 566) and finally we hear that Homer, who lends his Olympians such clear, human outlines, treats the Erinnyes with "epic vagueness" (p. 223).

It is difficult, indeed, without more assistance than Miss Harrison offers in these pages, to seize upon or draw clearly any precise line of separation between her Olympians and the nether-world potencies who enjoy her fastidious approbation. Nor is the cleavage between Olympus and the nether-world, as present to our author's mind, more clearly brought into general view by her first chapter, in which Olympic is distinguished from Chthonic ritual, on the strength of a definition of holiness reluctantly assented to by Euthyphro in Plato's Dialogue of that name. If this account of holiness is to pass current as manifestly characterizing Olympian observance to the exclusion of all Chthonic ritual and worship, the reason must be that Euthyphro, who is forced to assent, does so as a representative of exclusively Olympian worship. But how, we must ask, can he possibly be so regarded? The most casual reading of the Dialogue in question reveals that, through the whole of it, Euthyphro's dominant impulse, present throughout his stiff encounter with Socrates, is to clear himself from the pollution of blood (μίασμα) by which, through his father's callousness, he has become tainted. He is in a state of superstitious terror, and even uses the very verb (ἀφοσιῶ) which, according to Miss Harrison, "lay at the root of the Orphic and Christian notion of spiritual freedom," and contains the primitive notion of "release from tabu," so that it "may be rendered as 'to purify by means of an expiatory offering'" (p. 504). Euthyphro's acceptance of "an act in which gods and men do business with each other" as a definition of holiness cannot, therefore, attach itself to one species of Greek religious observance more appropriately than to every other, nor was it at all meant by Plato to bear the enormous burden laid by our author upon it. Indeed, Euthyphro's case is one aptly illustrating "the strenuous effort after purity of life" so impressively mentioned in the closing sentence of this book, as one of the two redeeming and illuminating impulses present alike in the highest and the lowest forms of Orphism.

But, after all, Miss Harrison's topic is not the Olympians, and she must be permitted not to give a connected account of them, since she unmistakably announces beforehand that they are no concern of hers. The same is true of each one of the individual Olympians. Zeus enters on the scene chiefly as invading the rites of a snake-god, or again as an interloper in the cave of Chiron, and he is cavalierly dspatched as the "archipatriarchal *bourgeois*" (p. 285). Apollo is, in one place, polished off as a "parvenu"; among the Olympians, women-goddesses, elsewhere above suspicion's breath, "became abject and amorous" (p. 273)—all excepting Athena, who becomes "unreal, theatrical" (p. 304), and Artemis, who "lies properly outside our province" (p. 301). So do all the Olympians. Miss Harrison takes them to be latecomers in Greece, brought in from the North by Professor Ridgway's Hiberno-Achæans, and detains them only long enough to bid them stand and deliver those numerous ritual observances upon which her learning and ingenuity, in league with Dr. Verrall, Professor Ridgway and others, contrive to lay an embargo in the name of Chthonic ritual.

However ardently we may desiderate for the future some connected account of the

Olympians to smoothe over the rough places at which, lacking her further aid, the reader of her *obiter dicta* so constantly stumbles, it was no doubt necessary to get these Olympians somehow out of the way before we could enjoy a fair glimpse at the lower stratum of our author's predilection. Yet she can never have done with the Olympians, and is always busying herself in describing her own nether-world favorites in terms of the Olympians, and never quite identifies one of them until she has found him lacking in the Olympian quality. "Not content with relieving us of all our valuables," our Olympian might say, "the lady keeps us prisoners after our ransom has been paid, and untiringly heaps insult upon injury."

SIX MUSICAL BIOGRAPHIES.

Beethoven. By J. S. Shedlock.—*Mozart.* By Ebenezer Prout.—*Mendelssohn.* By Vernon Blackburn.—*Sullivan.* By H. Saxe Wyndham.—*Gounod.* By Henry Tolhurst. London: Bell; New York: Macmillan.

Chopin. By J. C. Hadden. E. P. Dutton & Co.

The publishers of "Bell's Miniature Series of Musicians" were well advised in choosing as editor C. C. Williamson, who has proved his fitness for the trust reposed in him at the outset by his judicious choice, in most cases, of the writers to whom he assigned the different composers. This is true particularly in the case of the 'Beethoven,' the 'Mendelssohn,' and the 'Mozart,' written, respectively, by J. S. Shedlock, Vernon Blackburn, and Ebenezer Prout. The 'Wagner' and 'Haydn' by John F. Runciman, also, will, it is safe to predict, prove worthy of high praise as well as novel in treatment. In these books an attempt is made to give in from fifty to eighty pages a bird's-eye view of the principal facts regarding the lives of composers and their works. Mr. Shedlock's 'Beethoven' may be taken as a good example. Twenty pages are devoted to a biographic sketch, and this is followed by sections on the symphonies, sonatas, quartets, "Fidelio," masses and oratorio, characteristics, sketch-books, a list of principal compositions, and a bibliography. One does not, of course, expect any new facts or points of view regarding Beethoven in such a brief sketch; but Mr. Shedlock cites (p. 32) an interesting account of the first performance of "Fidelio" by Dr. Henry Reeve, which biographers have heretofore overlooked. Oddly enough, Dr. Reeve found the story "a miserable mixture of low manners and romantic situations," and the overtures "too artificially composed to be generally pleasing." One may forgive Mr. Shedlock the pleasing delusion that Beethoven provided a "special unity" for the different movements of his sonatas, making them, as it were, different acts of a drama. In the list of principal works, he includes of the symphonies only the third, fifth, seventh, and ninth. Why not the "Pastoral"? And in the list of chamber music why was the A major sonata for piano and violoncello omitted? It is certainly one of Beethoven's most inspired works. The author's modesty should not have led him to omit mention (in a footnote or in the bibliography) of the chapter on Beethoven in his own 'History of the Pianoforte Sonata,' where these sonatas are treated with an insight and a critical candor unique in the literature of the subject.

Mozart's life, despite its shortness, was marked by more incidents of interest than Beethoven's, and Mr. Prout accordingly bestows on it fifty-two of his sixty-four pages. In declaring that Mozart's pianoforte works do not rank among his greatest achievements, the writer shows a discernment which we miss in his prediction that Mozart's symphonies will outlive those of Tchaikovsky. It may be that Mozart was, as Mr. Prout claims, the most wonderful "all-round" musician that the world has ever seen; yet he is never at the head, having been surpassed in every branch by other masters.

That Mr. Vernon Blackburn's 'Mendelssohn' would be unconventional, judicious, and a good piece of literature, was a forgone conclusion. It takes courage even now to say to an English audience, with reference to the resurrection of Bach's "St. Matthew's Passion" by the subject of this monograph: "I sometimes think, even confronting so beautiful a score as the overture to 'A Midsummer Night's Dream,' that this was Mendelssohn's greatest gift to our time." Mr. Blackburn dwells considerably on that trait in Mendelssohn's character which made him declare that to play the pianoforte before Queen Victoria was the greatest joy of his life. He also comments on the lack of the heroic element and virile resistance in Mendelssohn. Lucky and successful, as a rule, beyond all other musicians, the slightest rebuff embittered him; had he been "compelled to endure the whips and scorns of time which fell to the lot of Wagner, it is likely that we should have had little enough work from his pen." "The strangest part about his end was probably the extreme depression of the brain: he could not remember his triumphs; he could only remember his failures." But we must resist the temptation to quote more from Mr. Blackburn's fascinating little volume.

The treatment of Sullivan and Gounod is less authoritative and commendable than that of the foregoing booklets, but these volumes, too, will serve their purpose fairly well. Mr. Tolhurst, of course, has a good deal to say about "Faust," and he devotes a chapter to "The Redemption." But why is no mention made in the bibliographic section of the admirable pages on Gounod—the best ever written—in Saint-Saëns's 'Portraits et Souvenirs'?

Mr. Hadden's 'Chopin' does not belong in the same group as the foregoing; it is one of the series of "The Master Musicians" issued under the editorship of Frederick J. Crowest, whose qualifications for such a post were discussed in the *Nation* of August 12, 1902. Mr. Hadden, as a rule, follows good models—Huneker, Niecks, and Hadow; but in his opinions he frequently out-Crowests his editor. To take a few samples: On page 3 we are informed that Chopin might have been actually "great" if he had only lived longer. "But these are vain speculations"! On p. 201 we read that Chopin was "the Shelley and Keats of music"; and, a few pages further on, that he was "no mighty-mouthed inventor of harmonies," and that Liszt "lacked the technical training necessary to develop in a natural way." Can it be that Mr. Hadden wrote these chapters originally for serial publication in *Punch*? Except from the comic point of view, there is no real justification for the existence of this book. Everything that can be taken seriously in it has been much better said elsewhere; but the chapters on George Sand and Chopin's love affairs may divert the casual reader. The reference to the fact that in Chopin's day such singers as Malibran-Garcia, Pasta, Rubini, Lablache, and Schroeder-Devrient were to be heard in Paris, calls attention to the fact that there were star casts before the days of Maurice Grau and Augustus Harris.

L'Art dans l'Italie Méridionale. Tome Premier: de la Fin de l'Empire Romain à la Conquête de Charles d'Anjou. Par Émile Bertaux. 404 Figures dans le texte, 38 planches hors texte en phototypie, et deux tableaux synoptiques; dessins et photographies de l'auteur. Paris: Albert Fontemoing. 1904.

This book avowedly proceeds from the French School at Rome, and is published under the patronage of the French Ministry of Public Instruction. The author is lecturer on the history of modern art at the University of Lyons, and has been a member of the School at Rome. The French historical movement, so strongly marked since the close of the Franco-Prussian war, and showing itself in a multiplicity of works devoted to special races, special lands, brief epochs of time—monographs as they might be called—is also seen in the production of such books as this. It need hardly be urged that it is in this fashion that history is now in the way of being rewritten. For good or for evil, we take each man's study of the period, the land, the political movement, which he has made his specialty, and affix to that other studies made by other scholars. In like manner this history of the art of Southern Italy is not to be begun upon by any reader with the idea that he will find in it a large consideration of the relation of South Italian art to the rest of the arts of the Middle Ages. Instead of that, he will find the closest possible study of documents, the most severe and minute examination of each of those documents, and a reproduction of all such material as is reproducible by photography. To this are to be added drawings made by the author, which, though not charming in themselves, are evidently what he needed for his purpose. They are not to be associated in the mind with those trivial drawings of Romanesque buildings with which the historian Freeman was perfectly well satisfied, as it seemed, but which could not but shock a reader interested in the aspects of things. Mr. Bertaux's drawings are light and slight, but they have significance; and it is gratifying to feel the confidence that one does feel in the plans of churches and the like which he has furnished.

The book begins with a long preface which in itself is a treatise on the art of collecting and comparing information under difficult conditions. It includes a most curious analytic account of what the author's predecessors and contemporaries have done in the study of the mediæval art of Southern Italy. There is, as of necessity, a rather too kindly account of some of those predecessors, so few, so feeble for the most part; for, as the author says, there has been no Vasari for the South, no original work to verify. This is a fault for which

every reader knows how to make allowance.

On the other hand, what is said of the shortcomings of Salazaro's folios, and of the ill-luck which attended the great work, intended to be "final," of Schulz and Quast, is perfectly well said, just and discriminating. The fourteen pages of preface once overpast, there follows the introduction, which is a sketch of the historical topography of South Italy; or, rather, as we cannot use the English word topography in just that sense, a sketch of *la Topographie Historique*. This way of beginning the study reminds one of the great history of France now in course of preparation by M. Lavisse, for in that the whole first volume is devoted to the topography of France. The way in which such an essay on "topography" is made "historical" is by insisting on the Roman roads as being in themselves of such a nature as to change the face of the country—as being important in the same sense that a watercourse is important or a path through a rugged chain of mountains. This view is enforced by a map of South Italy taken from the heart of Umbria to the point of Calabria, in which the primary and secondary roads are laid down.

The First Book, then, treats of the history of art from the end of the Roman Empire to the Saracenic invasion. The author has not been tempted to go as far back into classical art as another might have done. The temptation must be almost irresistible to show the close connection between the fading Imperial art and the feeble beginnings of the mediæval spirit in Christian basilicas. Allusions to this there are in the text before us, but the story begins almost at once with the earliest churches and their decoration, and with Chapter II. we are in full course of investigation with the Campanian Mosaics before the time of Justinian. Here the illustrations begin in regular series—with the fifth-century mosaic in a Naples baptistery so little known that the guide-books barely mention its existence, and what is left of the Chapel of Santa Matrona at San Prisco near Capua, which the guide-books do not name at all and which Venturi, writing more briefly, omits, though Salazaro gives a colored plate to one of its mosaic-covered vaults. With Chapter III. the ancient Duchy of Naples and the Byzantine cities of Southern Italy are considered, down to the tenth century. The extraordinary crypt of the Cathedral of Otranto on the Adriatic coast is the subject of the first large photograph which the book offers us, and the second is an extraordinary sculpture from the Naples church, while a great number of the author's drawings of capitals and bas-reliefs are distributed through the text.

In this way the First Book occupies 110 pages. The Second Book deals with monastic art under the monks of St. Basil and the monks of St. Benedict. The Third Book speaks of the art in country and in town—in the great centres and away from them—during Norman domination in the South; and Book Four deals with the art of the mountain regions, the Basilicata and the Abruzzi, from the eleventh to the thirteenth century; while finally the Fifth Book deals with art under the Emperor Frederick II., a culminating period at which one might well close the first part of an elaborate record. This latest division of the work is mainly devoted to the Gothic architecture and sculpture of the far South, a subject little studied. The pages are crowded with illustrations. One purpose of the array of documents and their exposition is the bringing well to the front of a new name in the list of creative artists, "Magister Nicholas Pietri de Apulia," concerning whom and his separate individuality a vigorous controversy is raging.

The usual array of carefully made indices close the volume, and leave the reader in his frequently recurring state of irritation that it has not been thought practicable to unite these different alphabets into one. Geographical table, names of artists, subjects and personages treated—all might be worked into the same alphabet and the reader's patience greatly relieved thereby. On the other hand, it is a rarely given assistance that the index in every case includes the illustrations as well as the text, with a separate and easily distinguished bold-faced Arabic number to distinguish them.

The Pipe Roll of the Bishopric of Winchester for the Fourth Year of the Pontificate of Peter des Roches, 1208-1209. Transcribed from the original roll among the records of the Ecclesiastical Commissioners, extended and edited, with an introduction, index, and glossary, by the Class in Palæography of the London School of Economics and Political Science (University of London) under the supervision of the Lecturer, Hubert Hall, F.S.A. London: P. S. King & Son. 1903.

This attractive quarto is of interest for two reasons: it evidences the character of the study of economic history in England to-day, and it contributes certain definite additions to our knowledge of the industrial life of the early thirteenth century. Ten years ago the prosecution of inquiry into the early economic history of England was being carried on by a few able investigators, each working in practical isolation along his own lines. The volume under review, however, shows that the competent and ambitious English-speaking student bent on research work in industrial history need no longer resort to the Continent or sit at the feet of a Schmoller. Both efficient leadership and able coöperation on the part of a mature lot of students went to the making of this study.

The Seminar Class in Palæography in the London School of Economics under the direction of the Lecturer, Mr. Hubert Hall of the Public Record Office, overhauled this venerable record of manorial economy; transcribed, extended, and annotated the text, and prepared the introduction, the appendixes, and the glossary. The roll itself contains the financial accounts of thirty-seven manors whose revenues were paid to the see of Winchester. The accounts of each manor are separable into what would be termed to-day an income account and a capital account. In the income account the gross and net receipts of each manor, computed in money terms, are first stated. Then follow the money payments made by the Bishop's local representative into the episcopal treasury, after deductions are allowed for the upkeep of farm utensils, farm labor, and the maintenance of the bishop's household or retinue. The capital account, unlike the income account, is computed not in terms of money, but in units of quantity or number. Thus, the livestock on hand at the beginning of the year is given by number. Their natural increase, the deductions due to murrain or to sales, or to transfers to another manor, or to other causes, are enumerated, as well as the stock remaining on hand at the end of the financial year. Similarly with the stock of provisions of grain of various sorts. In short, a very good cross-section of industrial history, as exemplified in the manorial economy on church estates just before Magna Carta, is afforded by this document.

Besides the curious sidelights which it casts upon various phases of industry, such as the incredibly small yield per acre—about 4.3 bushels of wheat, for example—this series of inventories may well compel a careful revision of some doctrines which have gained general acceptance. Ashley, in his 'Economic History' (I., 43), says that the "substitution of money payments for labor dues . . . marked the beginning of a change of supreme importance." By this change he refers to the supersession of the *Naturalwirtschaft*, or barter-economy, by the *Geldwirtschaft*, or use of money as an exchange standard and medium. But from the analysis of this document it would appear that instead of the commutation of personal service for money payments marking the beginning of the aforesaid transition, there is comparatively slight mention of the payment of money in lieu of service, even at a time when money payments made by tenants to their lord were very considerable in number and amount, and when money bargains between the inhabitants of each manor were frequent. If economic historians have not overemphasized the early régime of barter, it seems pretty certain that they have generally been inclined to postdate it. The system of money reckoning would seem to have been more prevalent in early England than has hitherto been supposed.

Educational Psychology. By Edward L. Thorndike. New York: Lemcke & Buechner. 1903.

The layman's dislike of "Child Study" is no doubt a prejudice due to some vague impression that it is not the best thing possible for the child, the actual "mediocre nine-year-old child" under experiment, whose reactions are being measured, whose motor control is an object of the nicest calculations, whose temperature is taken "before and after simple tests of mental abilities," who is, in short, the *corpus vile*, the laboratory frog, of the new science. But his distrust of pedagogical psychology, his skepticism as to the practical application by the teacher of the laws that are to be deduced from all these experiments and observations, has at least so much professional support that the psychologists themselves disagree on that vital question: Can you improve the quality of your teaching by a scientific knowledge of the mind of the child? But the layman need not stop there. Let him push the question further and inquire whether you can, in any case, measure a mental fact as you measure a physical fact, whether you can talk of its weight, its duration, its volume, as though you were dealing with quantities. Kant, he may remember, thought not; and though, among professed psychologists, the

Kantian view does not prevail, the distinguished director of the Harvard psychological laboratory assures us that what the psychologist measures with his kymograph and sphygmograph and ergograph is "not the time of the primary mental experience, but the time of physical processes into which we project our mental states."

In the present volume, Mr. Thorndike, as his title would lead one to expect, takes for granted much that Professor Münsterberg questions or denies. In his preface he states that his aim is "to apply to a number of educational problems the methods of exact science." His first chapter, on the "Measurement of Mental Traits," asserts that "we can measure the ability to add or to spell or to translate Latin . . . as accurately, though not by any means as easily, as we can height or weight" (p. 4). Certainly Plato, who, as a philosopher, was a very suitable person to decide how far one science may express itself in the terms of another, expressed in an arithmetical formula his belief that the cubic content of the ideal king's pleasure is 729 times greater than the cubic content of the pleasure of the tyrant. But that was one of Plato's mathematical jokes; mathematical psychology must not claim a writer who continually dragged in mathematical analogies partly because of his æsthetic pleasure in geometrical forms, partly because ethical speculation has always found comfort in the terminology and imagery of mathematics. Mr. Thorndike's "practical certainty that the average ability of twelve-year-old boys is between 13.355 and 14.765" depended on a single test made once, viz., the marking of certain letters in a page of Spanish; he would be the last to deny that a second test would probably give quite different results. His diagram, with its "surface [why not curve?] of frequency," has no objective value whatever. Group measurements by teachers usually labor under two defects: the teacher is seldom a trained psychologist, so that his results cannot be regarded as a scientific contribution, while in what Mr. Thorndike calls "The Broader Studies of Human Nature" (Chap. XIV.) what is collected is not objective facts about the pupil questioned, but the teacher's subjective impression. Mr. Thorndike has, of course, no illusions as to the value of a collection of answers to such a question as that set in a certain normal school: "Have liberalizing theological opinions made you better or worse, and how?" (p. 157), but he believes that "affection for dolls can be studied as scientifically as reaction-time or rate of movement." There we do not follow him; affection for dolls never can be estimated quantitatively, as he asserts; it can only be described and analyzed qualitatively.

The subjectivity of the compiler, the ignoring of the selective agency, the impossibility of ensuring the good faith of the questioned, to say nothing of their ability for self-examination—all these lions in the path of educational psychology Mr. Thorndike recognizes and faces with admirable faith and courage. He is concerned with the ways and means of education, and he believes that some day there will emerge generalizations of practical value for the teacher from a perfected science of mental measurement. When that time comes, the child's intellect will be measured for its education with as much accuracy as its body is measured for a new suit. He sees of course that there can be no quantitative calculation without some unit of mental measurement; he therefore invites the coöperation of trained students to discover for educational science "lists of words in spelling, of examples in arithmetic, algebra and geometry, of questions in geography, history and grammar, exercises in Latin, French and German, etc., so chosen that any one will be of approximately the same difficulty as any other, or at least so that a given group of two or three or four will be of equal difficulty with other given groups" (p. 169). This is an attitude that should conciliate Professor Münsterberg and his school, who will lose half their grievance against a pedagogical psychology that measures the mind not in terms of physical science, but of questions in history. Unfortunately the personal equation enters in once more: you could not maintain absolute secrecy as to the precise units of mental measurement that are to be to educational science what the inch, the ounce, and the ohm are to physics; so you could never be sure that the decided superiority of any members of your group meant more than a superior ability to cram.

In his chapter on "The Relationships between Mental Traits," Mr. Thorndike forsakes his usual caution in handling statistics. His thesis is that relationships between mental abilities are far less close than educational literature would have us believe (p. 27). "In fact, the relationships are most noticeable by their absence or slight degree." His tables of coefficients of correlation are based on the marks of teachers and regents, and are derived from a few groups of school children only. We cannot see anything in them that would lead us to condemn as unscientific the present prevailing tradition of allied subjects, which is, after all, based on the same sort of judgments, namely, the experience of the teacher, but slowly gathered through generations, and not, like these tables, depending on evidence from a very limited field. We do not follow our leader when he asserts that such figures "clearly" illustrate his point, or that "the facts given in this chapter . . . should prove that the mind is a host of highly particularized and independent abilities" (p. 39). We decline to conclude from the table on page 37 that girls in the last four years of their grammar-school course will more profitably than boys combine English and mathematics, while boys rather than girls should elect English with geography. The table on page 39 adds a new terror to the teaching of arithmetic, if the diverse capacities required by a single school subject are to be taken at Mr. Thorndike's estimate by every conscientious teacher. "Wise teachers," he says, "will bear in mind that they are teaching not arithmetic to good and bad arithmeticians, but addition, subtraction, multiplication, fractions, etc. . . . to children whose capacities for these several lines of work are in each case a separate problem." At first sight such a refinement of individualism would seem to make class teaching impossible. But, after all, your educational psychologist who has to teach a class of fifty children arithmetic, confronts precisely the same problem as his old-fashioned colleague who, as time goes on, observes that Tommy Jones can do fractions and Fanny Smith cannot, though at problems she can beat Tommy. The tact and intelligence of the teacher do the rest, and we have to be convinced that a knowledge of the precise coefficient of correlation of fractions and problems will bring him in closer touch with Fanny and Tommy.

The Views about Hamlet, and Other Essays. By Albert H. Tolman. Boston: Houghton, Mifflin & Co. 1904.

It seems rather a hazardous venture to combine within the limits of the same volume such disparate material as the fragment (in somewhat modified form) of a dissertation on "The Taming of the Shrew," presented many years ago for the doctor's degree at a German university, a note on the inaccuracy of the measurements in Poe's 'Gold Bug,' a criticism of the author's comment in 'Vanity Fair,' and so on, especially as this collection of miscellaneous pieces (all of which had appeared in scattered publications before) does not come to us with the authority of a name connected with other work of a more sustained value. And, indeed, one cannot say that there is anything very original in any of the various articles which make up this volume, either in the way of new interpretation or the discovery of new facts relating to problems of literary history. Nevertheless, there is a neatness and accuracy of workmanship distinguishing the volume, combined with a freshness and vivacity of style, which we believe will render it, on the whole, agreeable reading to professional students of English. Some of the articles, although hardly embodying anything original, have a practical value, and may be recommended to teachers for use with English classes. Such, for instance, is the article on Anglo-Saxon poetry; also, the article which treats of the stage of Shakspere's day—a subject which is just now for the first time receiving due attention. Of a less popular character, as accords with their origin, are the papers on "The Taming of the Shrew" and "Love's Labor's Won" (cited in Meres's contemporary list of Shakspere's plays). As regards the latter play, the identification with "The Taming of the Shrew," which Professor Tolman appears inclined to advocate, is not likely to supersede the current identification with "All's Well that Ends Well"; and, indeed, a Philistine might well question anyway whether it was worth while devoting more than one-sixth of the entire volume to the discussion of a problem, the evidence in regard to which may be fairly described as all but non-existent. The eclectic discussion of Hamlet-interpretations which is given the most prominent place in the miscellany, is very sound and judicious, and on the whole this article and that on "The Symbolic Value of Sounds" seem to us to show the author's critical powers at their best. On the other hand, it is difficult to understand why Professor Tolman should have reprinted, in a volume which must find its readers primarily among professional scholars, such an obvious compilation from generally accessible sources as the paper on "English Surnames."

In conclusion, we call attention to the article on the famous Shaksperean crux, or

at least what was once regarded as such, "Woo't drink up eisel?" The fact that the phrase "eisel and gall" was often used, in early English writings, of the nauseous draught presented to Christ on the cross, has been pointed out more than once, but we believe that Professor Tolman is the first to make the very plausible suggestion as to the part which the mystery plays concerning the crucifixion may have played in giving the word "eisel" its proverbial significance.

The Life of Frederic William Farrar, D.D., F.R.S., etc., sometime Dean of Canterbury. By his son, Reginald Farrar. Thomas Y. Crowell & Co. 1904. Pp. xxii., 361.

Mr. Reginald Farrar has wisely aimed at comparative brevity rather than at "a complete and exhaustive biography." The latter can hardly be needed. "Parish life is a prosaic subject to the public." The outlines of Dr. Farrar's career are familiar. Assistant Master at Harrow in 1854, headmaster of Marlborough College in 1871, rector of St. Margaret's and canon of Westminister in 1876, archdeacon in 1883, dean of Canterbury in 1895—beyond this list and that of his numerous publications there is not much of more than domestic interest. The disparaging adjective "popular" always clung close about him, and the critical grudgingly allowed him the praise of a rhetorician, plus immense industry and the virtues of his order. But this is not all the story. In his way he was what Heine half-jestingly claimed to be, "an anointed true knight of the Holy Ghost," *i. e.*, a champion of free opinion and free speech. Whatever his position as thinker and scholar, he was at least a cultivated man whose convictions were not merely traditional, and who proclaimed them with fearlessness and force. If it was not in him to revise all the doctrines like F. W. Robertson, or, like Maurice, to lay a philosophic basis for a semi-rational conception of the Church and her beliefs, his mind fastened on one tenet of the ancient orthodoxy, and attacked it with a noble and efficient zeal. To the emancipated it might seem that words were wasted upon so obsolete a topic as the lake of fire; but Matthew Arnold did not think so. Writing to America in 1878, when there was great excitement over the volume 'Eternal Hope,' and premising that Farrar was not his favorite prophet, he said that the canon had actually opened the heads of many worthy people in the great English middle class to the notion that there might be some doubt about the everlastingness of physical hell torments, and that this was a great gain.

The public gain was won by some loss, or at least annoyance, to the reforming preacher. Letters warned him that the pit of flame still yawned for him if he repented not, and a counter publication bore the alarming title, 'What Is the Eternal Hope of Canon Farrar?' But this small book, perhaps the most memorable of his works, was a departure from his usual eirenic course. In general, he was of what Miss Cobbe called the "First Broad Church," and of its mildest section. Most of his writings met the case of devout people who were willing to be gently enlightened; they were moderate, conciliatory, and edifying in a more rational way than most of their predecessors. Written not for scholars but for the masses, they doubtless helped towards the kingdom that "cometh not with observation," in the movement of religious thought towards a higher plane and a purer air.

Farrar's career offered no material for such a work as the famous lives of Dr. Arnold by Stanley and of Robertson by Stopford Brooke; nor could any sketch of him create a belated reputation, as did General Maurice's Life of his father. The present modest volume may be welcomed as the memorial of one who wrote much to the satisfaction of a multitude of quiet readers, and delivered one stroke that resounded through the English-speaking world.

Ruskin Relics. By W. G. Collingwood. With 50 illustrations by John Ruskin and others. T. Y. Crowell & Co. 1904.

This book is composed of a very readable collection of articles in personal recollection of John Ruskin from the pen of his disciple, friend, and official biographer, W. G. Collingwood. Most of these articles have already seen the light in *Good Words*, but the first chapter, on "Ruskin's Chair," was written especially for the present volume. It was suggested by the remark of a visitor to the Coniston Ruskin museum, who, after he had seen everything, was heard to say: "This is all very well, but what the public would prefer is to see the chair he sat in." Mr. Collingwood feels this desire for something tangible quite natural and justifiable, although great men would rather be judged by their work alone, without offering the privacy of their lives to public view. He says:

"Relics of heroes even the ancient Romans treasured. Relics of saints our forefathers would fight for and die for. Relics of those who in modern times have made our lives better and brighter we need not be ashamed of preserving. And among relics I count all the little incidents, the by-play of life, the anecdotes which betray character so long as they are truly and lovingly told."

Mr. Collingwood proceeds to tell us, after a brief description of the actual chair in Ruskin's study, of that metaphorical chair of "Professor of the Fine Arts at Oxford" to which he was elected and which he held to such good purpose, although so little either to the satisfaction of the dons or of the townspeople whose sons fell under the master's influence. One can easily imagine that, to the purely practical mind, a drawing-school, provided at Ruskin's great personal cost as to time and money, of which the aim was, not to paint salable pictures, but to inculcate, by a course of severe training, proper appreciation of Fine Art, so that its attainment should not be considered within the grasp of every one, must have had no *raison d'être*. In the second year there were but three pupils, and it was then that Collingwood joined it and worked diligently under Ruskin's directions. He tells us how he was later promoted to translating Xenophon's 'Oeconomicus' for Ruskin's "Bibliotheca Pastorum," and how exacting in preserving the Greek flavor in the translation the master was. Besides art and literature, the followers had to learn the dignity of labor practically demonstrated at the Hinksey diggings; and nature study also was one of the branches, in various forms, but always with great insistence on accuracy and fulness of observation. Ruskin's teaching consisted not only in making you see what he saw himself, but in helping you to look for yourself.

The following chapters are about Ruskin's boat and its construction; his garden, and theories of what a garden should be like; a journey abroad in 1882, in which the reader will note the leisurely method of travelling in years gone by, and its advantages over our present system of hurrying on. One of the most interesting essays is on Ruskin's drawings, under what influences he first practised the art, and the ultimate result of his lifework in that direction. Then follow rather discursive articles on Ruskin's Bibles and jewels and friendships, in which much is told of his ways and habits. The book reads like a supplement to Collingwood's Life of Ruskin, in which he had not space to tell all he wished to say. There are also several very trivial attempts at musical composition by the master.

The typography is in excellent style, and the volume is full of illustrations of varying degrees of interest.

The Journey of Coronado, 1540-1542, from the City of Mexico to the Grand Cañon of the Colorado and the Buffalo Plains of Texas, Kansas, and Nebraska, as Told by Himself and his Followers. Translated and edited, with an Introduction, by George Parker Winship. With map. New York: A. S. Barnes & Co. 1904.

Any one familiar with Mr. Winship's inestimable publication of the original documents on Coronado, and with his translation of them, through the medium of the Bureau of Ethnology, will recognize the contents of this handsome and very convenient 12mo reissue—which might, in fact, be termed a pocket edition—of the large quarto mentioned. The exceptions are the Spanish text and some notes that could well be spared the general reader, however valuable they are to a student. This is, in every respect, a timely and most practical work. While the specialist of course fully appreciates the changes wrought, in the last twenty-five years, in our appreciations of Spanish colonial history of the Southwest, the general public (represented largely by the "intelligent" tourist to New Mexico and Arizona) does not care for salutary innovations. Like most of the inhabitants of those parts of the United States, he clings to the fleshpots of Egypt in the form of dim fancies and vague interpretations, supposed to be more romantic than the plain truth. He does not know better and does not want to learn. It suffices him to be told that Santa Fé is the oldest town in the United States, it is "so romantic" to revel in the sight of the old "palace of the Montezumas," and to glory in the belief that the church of San Miguel is as old as the hills, and older if possible.

Mr. Winship has now taken away from these complacent souls the excuse that it is too difficult to get at the original sources, that the Spaniards were "such great liars," and the like palliatives for ignorance and conceit. He has also driven the Southwesterners who fed the public and them-

selves on credulity, from the field for ever. By this handsome little volume, which any one can carry along as easily as a Baedeker, he has placed within reach of any one the material furnished by the original discoverers of the Southwest, with such additional information as enables the reader to judge advisedly of the evidence. With this guide in hand, the tourist can go about from site to site and enjoy the romance of the past, if he is so inclined, virtually in company with the actors of the drama, reading their own words on the spot to which they refer, and in the best rendering possible. We heartily congratulate Mr. Winship on this eminently practical little volume. Its typographical execution is in full harmony with the excellence of its contents.

ADOLESCENCE

Its Psychology and Its Relation to Physiology, Anthropology, Sociology, Sex, Crime, Religion, and Education

By G. STANLEY HALL, Ph.D., LL.D.

President of Clark University and Professor of Psychology and Pedagogy

The first attempt in any language to bring together all the best that has been ascertained about the critical period of life that begins with the early teens and ends in the middle twenties. It is the summary of the author's conclusions, after more than twenty-five years of study and teaching, upon some of the most important themes in Philosophy, Psychology, Religion, and Education.

Cloth, 8vo. 2 vols. Gilt top. $7.50 net. Postage additional

THE BOOK OF SCHOOL AND COLLEGE SPORTS

By RALPH HENRY BARBOUR

Author of "Weatherby's Inning," "Behind the Line," etc.

The history and development and the rules for playing and conducting the games and athletic sports that have come to be such an important adjunct of school life, together with the records and provision for keeping additional records, is what Mr. Barbour has attempted in this book. It is the most comprehensive single volume on athletics yet printed, and should meet with great favor among all interested in outdoor life. The several departments have had editorial revision by Ralph D. Paine, Edward N. Robinson, W. A. Schick, Jr., Ronald T. Abercrombie, and others.

Illustrated, 12mo, Cloth, $1.75 net. Postage 15 cents additional

HARVARD MEDICAL SCHOOL

Open only to Bachelors of Arts, Science, or Philosophy, and Persons of Equivalent Standing.

The course of study required for the degree of M.D. is of four years' duration. The next year begins Sept. 29, 1904, and ends on the last Wednesday in June, 1905.

COURSES FOR GRADUATES IN MEDICINE.

Courses of instruction are offered for graduates of recognized medical schools, and are given in all the subjects of practical and scientific medicine.

The extensive laboratories of the school are inferior to none, and the clinical advantages afforded by the hospitals of Boston are unequaled in quality and extent.

SUMMER COURSES.

During the summer, courses in many branches of practical and scientific medicine are given to both medical students and graduates.

Facilities for research work are offered in all of the laboratories.

For detailed announcements address
DR. WM. L. RICHARDSON, Dean,
Harvard Medical School, 688 Boylston St., Boston, Mass.

The Misses Shipley's School

NEW SAYINGS OF JESUS

AND

FRAGMENT OF A LOST GOSPEL FROM OXYRYNCHUS

Edited, with Translation and Commentary, by BERNARD P. GRENFELL, D.Litt., M.A. Hon. Litt.D., Dublin; Hon. Ph.D., Koenigsberg, Fellow of Queen's College, Oxford; LUCY WHARTON DREXEL, Gold Medallist of the University of Pennsylvania; and ARTHUR S. HUNT, D.Litt., M.A., Hon. Ph.D., Koenigsberg Fellow of Lincoln College, Oxford.

The present text is nearly contemporary with the 'Logia' papyrus discovered in 1897, which also belongs to the third century, though probably to an earlier decade. In its general style and arrangement the present series of Sayings offers great resemblance to its predecessor. Here, as in the earlier 'Logia,' the individual Sayings are introduced by the formula "Jesus saith," and there is the same mingling of new and familiar elements; but the second series of Sayings is remarkable for the presence of the introduction to the whole collection, and another novelty is the fact that one of the Sayings is an answer to a question, the substance of which is reported. It is also noticeable that while in the first series the Sayings had little if any connexion of thought with each other, in the second series the first four at any rate are all concerned with the Kingdom of Heaven.

THE PRIMITIVE AGE

8vo, $3.50 *net*. By mail, $3.70.

England in the Mediterranean

A Study of the Rise and Influence of British Power Within the Straits, 1603-1713

By JULIAN S. CORBETT, author of "Drake and the Tudor Navy," etc. 2 vols., 8vo, $9.00.

FURTHER RECOLLECTIONS OF A DIPLOMATIST

By the Right. Hon. Sir HORACE RUMBOLD, Bart., G.C.B., G.C.M.G. Demy 8vo, $6.00.

Sir HORACE RUMBOLD begins the Second Series of his Recollections in the year 1873, at the point to which he brought his readers in the volumes already published. He begins by describing his stay in Chile, where he filled the position of Minister. Returning home in 1876, Sir Horace enjoyed a period of leisure that enabled him to meet in society all the most famous men and women of the day, and about this time he began to keep a diary "of almost Pepysian fulness," to the no small advantage of the readers of his "Recollections." Later on we follow him to appointments in Greece and Sweden.

"The further instalment of Sir H. RUMBOLD's Reminiscences fully sustains the interest of the two entertaining volumes issued last year."—STANDARD.

"The present volume abounds in good stories and sketches of the most eminent people at home and abroad in the latter half of the nineteenth century."—MORNING POST.

A Romance

By M. E. FRANCIS (Mrs. Francis Blundell). Crown 8vo, $1.50.

A NEW NOVEL BY RICHARD BAGOT

LOVE'S PROXY

By RICHARD BAGOT, author of "Donna Diana," "A Roman Mystery," etc. Crown 8vo, $1.50.

"MR. RICHARD BAGOT has already won a high reputation as a novelist, and his new book will certainly help to maintain it."—DAILY MAIL, London.

"The story is as good as anything its author has done, and should be heartily enjoyed by every one who reads it."—SCOTSMAN.

LONGMANS, GREEN, & CO., 93 Fifth Avenue, New York

The Nation.

NEW YORK, THURSDAY, JUNE 9, 1904.

The Week.

The breaking of the long deadlock in Illinois came about in the way best for the State, and for the Republican party therein, although the smashing of two machines was involved. Gov. Yates had an organization outside of Cook County, on a basis so low and mercenary that probably nothing but the Lorimer machine in Chicago could be more contemptible. Over both of them Mr. Deneen has won his way to the nomination for Governor. He is well spoken of by the best men in Chicago, having been an able and fearless prosecuting attorney. That, of course, was enough to secure him the hatred of the Republican machine in that city; and it was very likely because he was so offensive, being honest, to Boss Lorimer that Gov. Yates, having found that he could not possibly succeed himself, threw his strength to Deneen so as to humiliate as deeply as might be the Chicago machine. It was to that abhorrent organization that President Roosevelt surrendered in appointing the notorious "Doc" Jameson naval officer. The act seriously impaired his popularity in Illinois. But the nomination of Mr. Deneen probably makes the State Republican. To meet it, the Democrats will have to drop all their Hearst nonsense, and put forward a man for whom respectable citizens can vote.

Georgia Democrats have put an end to the talk that the Parker boom is sagging in the South. If there were any slack in the boom—to mix the metaphor—it was taken up with a jerk by the resolutions of the convention on June first. The proceedings are but further evidence that Judge Parker is the choice of the majority of sane Democrats in the whole country; and although the heart of Nebraska seems true to Bryan, nevertheless the Hearst and Bryan combination, with the whole following from the cave of Adullam, will be in a hopeless minority. Under these circumstances the position of Tammany under Charles F. Murphy is more difficult and dangerous than before. The Democrats of New York city who are not under Murphy's thumb are more serious than ever in pressing the question, "What does he want?" He is beaten in the State at large, and is crowded out of Brooklyn. What interest of the party is he trying to serve? Is he fighting for anything except the maintenance of his personal leadership of a faction in Manhattan?

"Mr. Hearst *now* feels that the delegates from Missouri should be *permitted* to vote for the man whom they regard as the best candidate." This is the authoritative announcement that the bad joke of the Hearst boom is at an end. It means that no more money is to be forthcoming, and with Hearst it has always been a case of no money, no delegates. An English newspaper states his campaign expenses to date at $1,500,000. The money might as well have been thrown into a sewer—in fact, most of it was. But note the unconscious self-betrayal of the statement that Missouri is abandoned. Hearst had planned to buy that State, but now concludes to allow unpurchased delegates to be chosen. The implication is clear that no one could be expected to vote for him without getting thirty pieces of silver. That, however, is all in the past. Those bygones the country will drop in a great sense of relief at Hearst's taking himself out of the field. He never was cut out for politics. His true mission was always the exploitation of crime; and the zest with which his newspapers are now returning to that congenial task shows that they consider his political dream to be over. A dream to him, to decent Democrats a nightmare.

Commissioner McFarland was almost ludicrous, at the Lake Mohonk Arbitration Conference on Thursday, in urging the election of President Roosevelt as the best way to expedite arbitration treaties. What we really want to know is, not whether Mr. Roosevelt believes in arbitration, but whether he believes in peace. Mr. Smalley, who does his best to be the President's apologist, cables to the London *Times*, apropos of the Cuban letter: "It explains why so many Republicans are alarmed when they ask themselves what Mr. Roosevelt may do if he is elected for four years." Mr. John Sharp Williams, writing to the *World*, is willing to admit that the President may have meant nothing by the blustering verbiage of this warning to the Spanish-American republics. But that is only another way of saying that, temperamentally, Mr. Roosevelt cannot repress the 'Ercles vein, and is the enemy of the world's peace perhaps without intending to be. Possibly he did not mean that the United States would feel justified in intervening because of the insolvency or weakness of a nation, but his letter to ex-Secretary Root, of which we reprint a portion since its terms have been questioned, means that, or means nothing:

> "Any country whose people conduct themselves well can count upon our hearty friendliness. If a nation shows that it knows how to act with decency in industrial and political matters, if it keeps order and pays its obligations, then it need fear no interference from the United States. Brutal wrongdoing, or an impotence which results in a general loosening of the ties of civilized society, may finally require intervention by some civilized nation, and in the Western Hemisphere the United States cannot ignore this duty."

Only a grateful officeholder could seriously advocate the election of the man who uttered these words of mingled platitude and menace on the ground that it would hasten the day when methods of violent intervention shall give way to universal arbitration.

Ante-mortem declarations have peculiar force in law, and should have in politics. Hence the dying message of Senator Quay, that "stanch and loyal friend" of the President's, ought to have great weight with Mr. Roosevelt. The expiring statesman warned him against making Cortelyou National Chairman. It was going to be a difficult campaign. Conditions were adverse, and might become more so before the election. Secretary Cortelyou was not the man for the job. A great deal of money would have to be corruptly raised and spent in the ways so effective in Quay's hands in 1888, and a more callous Chairman than Cortelyou was imperatively needed. This deathbed advice of an expert can scarcely go unheeded. Of course, the President has announced his choice of Mr. Cortelyou, and has "put his foot down" to the protesting Senators. But a foot put down can be lifted again. Already there are signs that the President is not going to be too obstinate in this matter. It is intimated that Cortelyou may be dropped for H. S. New of Indiana. Some might think the omen one to be averted. Mr. New's father was Harrison's right-hand man in 1892. In that year a Republican President failed of reëlection. But the main thing is, to give effect to the last political will and testament of the Pennsylvania sage and saint.

It is not often that the friends of protection have an opportunity like the present to show the stuff they are made of. The Panama Canal Commission is anxious to construct the waterway as cheaply as possible, and is clamoring for free import into the canal zone of the materials which it needs. Admiral Walker and his colleagues are excellent men and are to be commended for their intentions, but they fail to see that there are other points of view than that of mere economy. Of course, every one would like to have the canal constructed, other things being equal, in a thrifty manner. But, after all, what is economy among friends of protection?

Do not let us pursue a penny-wise, pound-foolish policy. The cheapest thing is often costliest in the end. Secretary Shaw has the right of the matter. He at least sees what a horrid mistake it would be to let foreign manufacturers provide the canal materials "at prices with which Americans could not hope to compete." He believes that the protective idea ramifies through every department of our national activities, and that all interests should stand or fall together. Besides, can Uncle Sam suppose it would be decent for him to fare better than his own children, whom he has given over to the friends of protection? A canal built under any such policy would, we are sure, bring disaster to every American ship that used it.

In sending a United States Assistant Attorney-General to Alaska to look into the conduct of Government officers, including the Federal judges, the Administration has taken another investigation on its hands. It is encouraging to learn that it will be prosecuted "just as promptly and impartially as were the examples in the Post-Office Department." The country is still waiting for the results of that fearless and complete overhauling of the Post-Office which Senator Lodge promised should be made "at our own time and in our own way." As for Alaska, the stories which visitors bring back regarding the conduct of officials there have long been disquieting, and should be looked into, even though no actual criminality may be disclosed. They bring out, at least, the inevitable difficulties of securing a fair and satisfactory administration of justice in a remote territory with a large element of adventurers in its population, and a general ambition to make fortunes out of the country, with small regard to the means employed. Alaska has fared badly enough at the hands of our Government, being denied even a delegate at Washington. It is doubly important that the officials in the territory should be of high character.

Barbarous by preconception, civilized by census returns, seems to be the fact as to the Filipinos. Gen. Sanger's census, at any rate, reckons only 647,740 of the 7,635,426 inhabitants (less than 10 per cent.) as "wild and uncivilized." Now it will be recalled that we assumed the charge of these people because they were supposed to be utterly incapable of managing their own affairs, and in particular liable to homicidal mania. They were social delinquents whom we must care for as a matter of painful charity. They could not be left to their own devices without disturbing the peace of the world. That was the horrid aspect of the Filipino when it was suggested to let him go his own way. Since he belongs to us, how different the case, how benign his air! Even the 9 per cent. of him that must be classed as barbarous is "not without some knowledge of the domestic arts." Furthermore, the barbarous tribes are largely settled on the three islands of Mindanao, Jolo, and Cotabato, natural reservations in which they need not have given more difficulty to a central government than our reservation Indians did in the West. But we call attention to the facts of the census in contrast with the hearsay of the annexationists not to brand again the old blunders and hypocrisies, but rather to emphasize the hope that lies ahead for us and for the islands. Unless civilized is used in some Pickwickian sense by Gen. Sanger's census enumerators, it will be impossible to hold this people long in tutelage. The time must come when we shall act not on the hysteria of a commercialized imperialism, but soberly on the facts, with justice and respect for our own institutions before our eyes.

The June estimates of the new cotton crop point to an improved situation. The high prices obtained by the planters have had the inevitable result—the acreage has been increased. The experts differ as to the amount of the gain, the *Financial Chronicle* estimating it at 3,368,000 acres, and the Agricultural Department at 2,823,000 acres. Even the lower figure is enough to signify a striking change in the outlook, especially when the improved condition of the crop is taken into account. On June 1, 1903, the Department estimated this at 74.1, but this year the figure is 83. If weather conditions are right and the boll weevil is kept under control, the yield this year will easily exceed that of any previous season. And even if the condition should decline to last year's ratio, the present acreage would mean a crop of a good deal more than 11,000,000 bales, against about 10,250,000 bales in 1903. This would indicate a surplus of about a quarter of a million bales above the highest annual consumption of American cotton in the past. Thus it is easy to see why, with spot cotton at 11.75 cents on Saturday, as against 17.45 in February, the contracts for the last quarter of the year, on the new crop, should be quoted at considerably under 10 cents.

The speculators are the only ones to be hurt. Even the growers will be better off. A repetition of 1903 would make them poorer instead of richer. The South has been boasting of its great access of prosperity from high-priced cotton, without taking into account its losses in other ways. Many cotton mills have had to suspend operations or run on reduced time. A number of dividend-paying companies have gone into receivers' hands, and one of the biggest mills in South Carolina had to issue bonds to keep itself out of the courts. Last year the growers succeeded in making the speculators and middlemen carry the cotton which the mills could not afford to buy; continued high prices next fall would undoubtedly reverse this and leave them "cotton poor." How much the country as a whole has to gain from a large crop this year is indicated by the wage reductions and the shutdowns in Fall River and other manufacturing centres, the dulness in the dry goods trade at home, and the curtailment in our cotton goods exports since last July of over 50 per cent. For over a year and a half cotton prices have been boomed, but the people who wear the goods have refused to buy. A short crop at high prices has not brought prosperity, but now that a large crop at low prices begins to loom up, the industries of the country may take heart.

What the labor problem means to the South can be seen from a report just published by the Department of Commerce and Labor, containing the census figures on the cotton ginned in the United States. The value of the 1903 crop is estimated at $660,549,230. With a proper supply of labor the yield could be enormously increased. Cotton is still picked by hand, just as it was in India a thousand years ago. During the harvesting months, an average day's work for a picker is about 100 pounds. At this rate it would require 1,088,000 hands, working 130 days, to harvest a crop as large as that of 1903. This would mean a labor cost of $70,750,000, or 10.7 per cent. of the value of the crop, for the harvesting alone. The growing scarcity of colored hands has raised the question of Italian labor. But the Italians rapidly acquire the American idea of wages. In many places in the North they have fixed their minimum rate at $1.50 a day. This is in excess of the price of colored labor. It is clear that the low cost of growing and picking cotton has had a great deal to do with increasing the yield in the last century.

Amid all the talk of the abnormal criminality of negroes as such, an item from the April Juvenile Court Record has a certain significance. Reviewing the first year's work of the New York Children's Court, it points out that, of the 7,000 children arraigned, "there were only thirteen children with negro blood in their veins." Of course, no accurate deduction could be made from this fact without going into the question of relative population, and so on; but we may be sure that if the negro proportion had been unduly high, the thing would have been ventilated. One consideration has, in fact, to be borne constantly in mind: every case of unnatural crime

or brutality by negroes is at once sent echoing through the press. Yet the same newspapers will condense and minimize accounts of the deeds of white degenerates, and let them drop from notice as soon as possible. Thus exaggerated emphasis often gives a wrong impression, which a careful sifting of the actual facts would dissipate.

The slaughter of twelve men by dynamite at Independence, Col., is one of the most dastardly acts in the black history of labor-union outrages. The Colorado miners are simply following to its logical conclusion the principle of the closed shop, the principle that no man has a right to work unless he will curtail his hours, restrict his output, and tie himself hand and foot by the arbitrary rules of a union. A few labor leaders have sincerely exerted their influence against violence; others have publicly denounced it while secretly encouraging it; but the Colorado miners—like the Coeur d'Alène miners of a few years ago—have the courage of their criminal desires. They will kill any man who opposes them, and they do not stick at the most cruel and cowardly means. The spirit which they show is exactly that which dominated the Pennsylvania anthracite regions during the long strike of 1902. However loud the professions of John Mitchell, the ugly fact remains that the assaults, the house burnings, and the killings were intended to intimidate non-unionists, and accomplished this purpose. Even the president of the peaceful garment workers declared on Monday in Boston that rather than accept the open shop he would tie up the trade all over the country. He did not advocate murder and arson; but his theory, and that of all who fight the open shop, is at bottom the same as that of the franker and more brutal miners.

Postmaster-General Payne hastens to explain that his department never intended a general crusade against worthless patent medicines, but merely issued fraud orders against the makers of half a dozen nostrums of a particularly objectionable class. It appears that action on these cases was precipitated by a large number of complaints from citizens against the offensive advertising. What he would do in case similar complaints were made against the popular remedies which are sold for something which they palpably are not, he would probably not care to answer beforehand. Would the Attorney-General, for instance, recommend a fraud order against a preparation advertised as "simply liquid oxygen" which the Massachusetts Board of Health found to consist of 1.35 per cent. sulphurous and 1.08 per cent. sulphuric acid, with the rest water? At all events, by declining to undertake on his own initiative a general censorship of drug-store shelves and newspaper advertisements, the Postmaster-General has saved himself from a task compared to which the restriction of second-class privileges is simplicity itself.

The centenary of Richard Cobden's birth was marked on Friday by many commemorative addresses in this country as well as in England. His work for the repeal of the corn laws, for the commercial treaty with France, for international peace, and for disarmament, were recalled and lauded as was meet. Cobden was a mighty and triumphant reformer. The material he dealt with he had absolutely at command; and Tory antagonists who thought to put him down in the Commons, found to their dismay how formidable was his armament of exact knowledge. Cobden was also, in Bagehot's happy phrase, a "sensitive agitator." Londoners who first heard him were amazed. They looked for a burly demagogue—the man who had been rousing the North of England—and they found a slight and modest gentleman, scrupulously, almost painfully, fair in argument, who would not willingly misrepresent a single fact or vilify one of his opponents. His appeal was ever to reason and to the humane instincts. Coming to the point swiftly and sticking to it with astonishing tenacity, he was the great persuader of his generation. Showing himself impregnable in his facts, he came to be regarded as a man whose opinions were as little to be challenged. It was, therefore, only a deserved tribute to his mastery of detail and his invincible logic in driving home the truth, which Sir Robert Peel paid when he said at the passage of the corn-law repeal, "The name which ought to be and will be associated with the success of these measures is the name of Richard Cobden."

Controversy follows Mr. Whistler even after his death; the failure of the administrators of the Chantrey Fund to buy one of his works has worn out the patience of the critics of the Royal Academy, and that venerable institution will soon be the subject of a Parliamentary discussion. The sculptor Chantrey, it will be recalled, left a handsome bequest to be spent by the Academy in the purchase of fine works of art. Practically, the trustees of the Academy have limited their choice to the works of academicians and associates. Generally, a distinct preference for the mediocre has been shown. Worst of all, very ordinary paintings have been bought from this fund at many times their market price. In short, the fund has been perverted from its evident intention to a mere prize for exhibitors at Burlington House, or a sheer charity for unappreciated academicians. Public opinion has no effect upon the placid committee, which falls back upon the loose nature of its trust; and, indeed, there seems to be no direct way of improving the taste of the average British academician, nor yet of convincing him of his own deficiencies. But Parliament has a right to challenge the poor pictures that drift into the national collections by way of the Chantrey Fund.

Blazing indiscretions have usually been associated with Lord Salisbury's habit of terribly plain speaking. His mantle has fallen on Pius X., if we may trust the *Siècle's* informant, to whom the Pope explained the apparent discrepancy between protesting against President Loubet's visit to Rome while permitting Cardinal Svampa at Bologna to attend a royal fête. In a word, Pius X. declared that the protest was directed against France, and France alone. As for Italy elsewhere than in the Papal city, friendliness between Church and State is wholly compatible with the dignity of the Holy See. Such would be a fair inference from the interview. Too clearly this explanation rather aggravated the original offence; but when the Pope went on to praise "that great and noble nation, Germany," for demonstrating that a good understanding between Church and State is possible, when he characterized the French "as an obstinate people, who weary us with questions, and who obey only when the instructions of the Holy See are in accord with their own petty interests," he made the worst of Lord Salisbury's mordant epigrams seem inoffensive. Except for the just repute of the *Siècle*, one would suspect misquotation. But, after all, this interview is so exactly in the temper of the recent protest that the Papal Secretary appears in the whole matter to have been less a counsellor than a mere amanuensis.

It would be the height of absurdity to land an expedition to hunt up Mr. Perdicaris, and the seizure of a custom house to pay his ransom would be only nearer opéra bouffe because less perilous. It should not be forgotten that we are demanding of Morocco guarantees that we could not give to the Sultan himself if he were travelling in the United States. If he had the bad luck to be lynched, we should only disclaim responsibility for the act of a sovereign State, and pay an indemnity as a matter of comity. These are motives not for discrediting any reasonable measures to secure the release of the unfortunate Mr. Perdicaris, but for deterring the Administration from going too far in imitating Lord Palmerston's famous "Pacifico" blockade of the Piræus. The excuse for the presence of our squadron at Tangier is the anarchy that impends in Morocco. It greatly behooves us not to apply the match to the powder barrel.

TREASURY DEFICITS AND PROTECTIVE TARIFFS.

The Government's full figures for last month's revenue and expenditure show a deficit of $54,500,000. Since the extraordinary payments during May to the Panama Canal shareholders, to the Panama Republic, and to the Louisiana Purchase Exposition footed up $54,600,000, it follows that the public revenue and the ordinary public expenditure in the month almost exactly balance. This result will hardly bring about, for the fiscal year which ends June 30, the Treasury's predicted $14,000,000 surplus, and it leaves results for the coming fiscal year in great uncertainty. The probability is that we shall have to face a deficit—how large, depends mainly on the volume of import trade in the next twelve months. The difficulty now upon the Treasury is, in fact, the same that has confronted it on numerous past occasions—namely, our Government's reliance, for its principal source of income, upon protective tariff duties, whose yield is always subject to collapse in the shifting vicissitudes of trade.

This phase of the matter deserves attention. A nearly equal revenue and expenditure for the year would usually be accepted as a gratifying evidence of normal Government finance. Unfortunately, it has almost invariably signified in our own country the simple passing of the line in a movement from swollen yearly surpluses to a yearly deficit, or vice versa. If a trade "boom" is in progress, if our home producers cannot keep pace with the abnormal home demand, and if, accordingly, as in the fiscal years from 1899 to 1903 inclusive, importation of highly dutiable merchandise increases with great rapidity—then the Government's receipts expand so suddenly that the Treasury's daily problem is how to prevent such a drain of actual circulating money from the markets as will force excessive rates for loans and cripple industry.

But let the trade situation change—as it did change, with great suddenness, last summer—and the public revenue falls off alarmingly. Nor is the mere fact of declining income the most awkward part of the situation then presented. Such unexpected rise in the public receipts as occurs in a period of "boom" puts the largest possible premium on legislative extravagance. Congressmen with hobbies involving heavy drafts on the public purse, lobbyists with an eye to the fortunes of their associates or employers, swarm to Washington, and fortify their appeals by arguing that the money collected by the Treasury must be "put back in circulation" if distress in the markets is to be avoided. Appropriation bills expand by scores of millions; a new scale of public expenditure is established. But when the revenue declines, in response to a waning import trade, expenditure does not come down along with it. The result is perfectly familiar in a dozen past occasions. To what extent such a shortage will occur in the next few years the shrewdest financier would hesitate to predict. It may be slight; it may be very formidable; nobody can say, unless he can also say what the course of trade, of industry, and so of merchandise importations will be during the period.

Who is to blame for the present situation? Ten years ago conditions were somewhat similar, but at that time the Democrats were in control, and it was the easiest thing in the world to take a backward view and say that their advent to power was the cause of the mischief. That is not going to be an easy game to play twice in a decade. There has been no change in government, and, before one can occur, Mr. John Sharp Williams and his friends will be sure to exclaim, "Tell us this time in advance who is to blame for the situation!" Is it due to free trade? Is it a sign that Roosevelt is going to be defeated? If not, to what shall we trace it? Has it resulted from causes over which the Republican Administration has had no control? Has there been a great mistake in estimating the revenue? Apparently not. Eliminating the postal receipts, Secretary Shaw estimated the revenue for 1904 at $530,000,000. Up to May 30 the Treasury took in $493,300,000. If the June income equals that for May, the showing at the end of the twelve months will be $534,000,000. The trouble, then, must lie with the expenditures. Deducting the postal outgo, Secretary Shaw's estimate of expenses for the current year amounted to $516,000,000. For eleven months, however, the actual outgo has been $545,565,599. But the $50,000,000 of Panama Canal payment is included here. Leaving this out, the expenditures may be stated at $495,500,000. June is a light month for Treasury payments, but if we figure them this year at only $34,500,000 (the same as in 1903), the total ordinary expense account of the Government on June 30, 1904, will be $529,000,000, or about $13,000,000 in excess of Secretary Shaw's estimate last December.

If 1904 is going to look bad on the stump this year, what sort of an impression is 1905 likely to make? When Congress met last December, Secretary Shaw told it that he expected to take in $704,472,060 in the fiscal year ended June 30, 1905. Eliminating the postal revenue estimate, his figures would be $545,000,000, or $15,000,000 in excess of his estimate for 1904. Certainly, present conditions do not guarantee that result. On the other hand, expenditures for next year are going to be extraordinarily heavy. The appropriations of the last session of Congress were $28,000,000 larger than those for the previous session. The total appropriations were $781,000,000, and other obligations had been incurred which made $800,000,000 of expenditures necessary. All this carries the mind back to the early nineties. Under Republican rule the revenue was decreased from $403,080,983 in 1890 to $354,937,784 in 1892, while the expenses rose from $261,637,203 to $321,645,214. The people registered their protest in 1892. What they will do this year, we do not know; but the situation of the Treasury certainly calls for a Republican explanation. Let us have it at once, and let it be one which will hold good after the election, no matter how it goes.

GIVEN PLATFORMS, FIND THE PARTY.

The tradition of disorganized and leaderless Democracy is dear to the Republican heart. Only by an adamantine resolution can the Republican orator restrain himself from using in every speech the simile of the ship without a rudder, or the wild horses pulling six different ways. Look on this picture, and then on that of the Grand Old Party, an army where no man breaks from the line, not because there is any coercion, but because these seven millions of sturdy and independent Americans have, after painstaking study and investigation, arrived at precisely the same conclusions upon all matters of national polity. Thus we have on one side all unity and a platform that will make itself; on the other, anarchy and a platform in which the very nails will try to pull themselves out of the planking. If history be merely a fable agreed upon, this passes very well within Republican councils and makes an unconscious impression outside.

Suppose, however, that some observer who had never heard of these things—Mr. Howells's Traveller from Altruria, one of H. G. Wells's Martians, or Macaulay's New Zealander—came into possession of a file of this year's newspapers and tried from them to form a just estimate of the two great parties. Would he confirm the Republican view? Would the political palæontologist, with the dry bones of this year's State platforms to guide him, reconstruct the Republican elephant and the Democratic donkey in quite the fashion of Grosvenor and Dalzell? Let him begin with the tariff. He will discover that some fourteen of the Republican State conventions have adopted platforms which do not mention that great fountain of prosperity at all, either directly or by inference. Missouri, which devotes a plank even to the McKinley button-hole carnation, says nothing about the tariff. In California, Kansas, New Hampshire, and Ohio the tariff is praised, as it were, anonymously, the word not occurring in the platform, though there are some kind phrases for "pro-

tection to American labor." As for specific suggestions regarding tariff schedules, there are but two. The Washington Republicans "oppose any application of that principle [reciprocity] which contemplates the removal of the existing duty on coal and lumber." Should our traveller have in his hand a copy of President Roosevelt's first message, he would be perplexed to find that the coal schedules were the only ones in which any change was there recommended. Michigan had the frankness to ask for higher duties on sugar. Minnesota demands "enlarged markets for the products of our farms and factories," though giving a pious shudder at the thought of allowing the Democrats to help. La Follette's convention in Wisconsin had no such scruples, and declared, "We believe in a readjustment of tariff schedules in all cases where protection is employed for the benefit of capital and only to the injury of the consumer and the workingman." Eight conventions suggest revision of the tariff by its friends, while seven speak up more or less faintly for reciprocity in strictly non-competitive products. The others put such ideas beyond the pale.

Our Martian friend, before reaching this point in his investigations, must certainly have come across something about the President's career as a foe of Trusts. "He it was," say the representatives of his party in Kentucky, "who, when patriots dreaded the encroachments of the Trusts, grappled with their most powerful representatives and pushed the fight until the Supreme Court had placed them absolutely at the mercy of the law as enacted by the representatives of the people." Here is surely an achievement to be celebrated by every convention of the patriots whom Mr. Roosevelt had relieved from their dread. Yet out of the first thirty-five Republican platforms to come to hand, only ten so much as contain the word "Trust." Six others, to be sure, speak euphemistically of "dangerous aggregations of capital," of "unlawful combinations." The others are absolutely silent. The Ohio platform, which contrasts Democracy with Republicanism as "a divided party of obstruction and negation" against "definite principles culminating in beneficent legislation," contains neither the word tariff nor the word Trust.

"But," say the Republicans, "the tariff and the Trusts are settled issues. There is no more reason for reaffirming our faith in the Dingley and the Sherman laws than for saying that we believe in the Copernican system or the statutes against burglary. The presumption is that the Democrats disagree." So our Martian turns to the pile of Democratic platforms. He finds, up to date, five which frankly agree to accept whatever statement of issues the National Convention formulates. The platforms of Connecticut, Indiana, Montana, Massachusetts, Ohio, and Rhode Island discuss neither Trusts nor tariffs. North Dakota has a tariff but no Trust plank, and Kansas just the reverse. On the other hand California, New Hampshire, New York, Oregon, South Carolina, Nebraska, West Virginia, Wisconsin, Pennsylvania, Iowa, Michigan, and Georgia declare themselves decidedly, both on the Trusts and on the tariff.

There was much said by Republicans in the closing days of Congress regarding the differences of opinion revealed by the tariff speeches of Bourke Cockran, Champ Clark, and John Sharp Williams. Yet in the platforms since adopted there is no evidence of division on this issue. "Careful and fair tariff revision," demands California. Pennsylvania wants "immediate but careful and prudent reduction of the tariff." New York declares likewise for reasonable reduction, while the Oregon Democrats suggest that the tariff should be modified to benefit the people, and not the Trusts. Passing to the States controlled by the radical element, the Nebraska Democrats under Mr. Bryan's thumb "would restore the tariff to a revenue basis and administer it for revenue only." "Protection for protection's sake" they consider "an ingenious device for the exploitation of the masses by the privileged classes." Iowa, captured by Hearst, denounces "the vicious tariff system under which Trusts have been born, bred, fattened, and the species multiplied." A number of specific remedies are offered. Wisconsin Democrats would remove the tariff from Trust-made articles, while those of California and South Carolina would reduce the tariff whenever it permits manufacturers to sell cheaper abroad than at home.

Thus the fact is that, making due allowance for the inevitable differences of opinion among men engaged in the same cause, and accepting at their face the formal declarations of party organizations, the reader is in no doubt whatever as to Democratic purposes regarding the tariff issue, while left in perplexity as to what the Republicans propose to do about it if again entrusted with power.

THE WAR AND THE KEY-THEORY.

When the Russians in 1897 wrested Port Arthur from the Chinese, everybody spoke as if the command of the Yellow Sea had been formally transferred to the Czar. And, indeed, the tip of the Liao-tung peninsula fulfilled every requirement of a "key," and was not inaptly called a Gibraltar. It commanded everything in sight—Tien-tsin, the harbor of North China; Niu-Chwang, the port of the fertile Mantchurian plain; it dominated Western Korea, threatened the whole of Shantung. One would have thought that the mere possession of this mountainous peninsula made Russia impregnable in the Far East. A sober critic like Alfred Rambaud said that in the China Sea "the position of Russia is far the strongest"; by it she "commanded" Peking and "penetrated" China. More imaginative commentators saw in the Liao-tung peninsula a sword aimed at the heart of China. All agreed that the seizure of this point of land vastly increased the strength of Russia, and rendered her practically impregnable in the Yellow Sea.

Yet not quite all. Lord Salisbury said flatly, speaking at the Albert Hall on May 4, 1898, "I think Russia has made a great mistake in taking Port Arthur. I do not think it is any use to her whatever." These words, which at the time passed merely as a cynical apology for Lord Salisbury's own failure to thwart the Russian advance—as an aggravated instance of diplomatic sour grapes—read very like prophecy now, when the dispatches are full of the apprehension felt in St. Petersburg concerning Port Arthur. Skilled strategists advised its evacuation early in the war, and its defence is admittedly a cruel hindrance to Kuropatkin's programme in the north. From the night that Togo's torpedo fleet sailed in, it has not commanded or dominated or even frowned upon anything. It has, on the contrary, been constantly buffeted and a prey to fears. Far from being a "sword" or even a "key," it has been a kind of sixth toe of the Empire—a superfluity at best, and most liable to be trodden on. On this matter there should be no illusion. Kuropatkin could not and cannot go to the relief of Port Arthur without taking the risk of being cut off from behind, and if the Japanese have delayed their descent upon Niu-Chwang, it is less because Port Arthur theoretically blocked the way than because Kuropatkin's main force at Hai-Cheng was only a few miles away from the landing-place.

This state of things is commended to amateur strategists who urge the random annexation of keys, "stepping-stones," or coaling stations. Only seven years ago Port Arthur was generally conceived of as something that of itself might repel all trespassers in the Russian sphere of influence; to-day Port Arthur appears chiefly as a point that may be attacked and defended with considerable difficulty. This startling reversal of rôles suggests that keys are really worth nothing in themselves unless you can afford to keep them, and that their keep is very expensive. Port Arthur has been and is worse than worthless to the Russians; it would indeed be only a source of weakness to any Power which did not control the China seas. Keys, then, are valuable only if they can be used to open something. The mere possession of a collection of them exposed to the cupidity of the first muscular passer-by may minister to chauvin-

istic vanity, may win an election or two, but certainly weakens a nation.

At Washington that is coming to be realized. It is no longer customary to speak of the Philippines as the "stepping-stone to the East." Quite the contrary, there has been a marked tendency to groan under the bills for fortifying Manila and increasing the navy. In well-informed circles it is thoroughly understood that the possession of these islands makes us not stronger in the Pacific, but more vulnerable all around; that the notion that the annexation meant an increase in naval or military strength was the wildest of delusions. In this whole matter one should not fail to note a kind of mathematical fallacy that infects amateur tacticians. They fail to perceive so elementary a principle as that "stepping-stones" may be used in either direction, while strategic keys are invariably reversible. The key that seems to fit only your rival's portal fits also your own, and any stronger hand may turn your own key against you.

Dalny is to-day a convenient naval base for the Japanese, as Port Arthur may soon be. This goes to show that dispersed keys are a fleeting possession. A man may be so rich in them that he owns one or more in every neighbor's yard; but the man who has one or two on a chain in his pocket is the true claviger after all. All this speculation over maps is nought. Strategic positions are vain things for safety unless they are accessible to supplies and reinforcements. The mere fact that Gibraltars frown shows that they are frowned on; that they "command," that they are commanded. In short, the whole doctrine of the abstract desirability of keys rests upon a false analogy between international policy and burglary. It is assumed that here and there skeleton keys may be seized and surreptitiously employed to open commercial and military doors. But a very little observation would show that international politics has not yet sunk to burglary, the most boasted and popular kind being still on the nobler basis of frank robbery. In a world where doors are generally battered down, keys are relatively of decorative value. That, in spite of arbitration treaties, is the condition of the world to-day.

"EUGENICS."

We do not imagine that Francis Galton has read President Roosevelt's letter on "race suicide," but a recent address of his before the Sociological Society is a good corrective of it, and of the whole order of ill-considered ideas lying behind it. That a nation or a stock should simply multiply is by no means the highest good—is not necessarily a good at all. It is a military conception, to be sure, that there should always be plenty of "food for powder." Napoleon, who asked what were the lives of a million soldiers to a man like him, was anxious that French mothers should make good his ravages. Such barbarous notions still persist. But Mr. Galton brushes them all aside with the statement that the real problem of civilization is how to improve the race, not merely to give it a cheap numerosity.

"Eugenics" is the name which he invents for the science dealing with the influences that better the inborn qualities of a given race, and develop them to the utmost advantage. Its principles are not mysterious. First, there must be agreement upon the type which it is desirable to produce. Then will follow the question of the best means of perpetuating it. All but the whimsical are of one mind in designating health, energy, mental capacity, manliness, inbred courtesy and honor as qualities most conducive to the good of society. How are they to be increasingly secured in civilized countries? How can the class embodying them be made typical and dominant? Evidently, not by turning society into a rabbit-warren. Unsuitable marriages, recklessly fertile, Mr. Galton would put under the severest of social bans. Under modern conditions, he would consider a family "large" that contained as many as three adult children. That would best fit in with the definition of a thriving family as one in which the children had gained a superior position.

This thought of levelling up runs through all that Mr. Galton has to say about race improvement. He is not for monotony of type. Varieties of character and of ideals are to be cultivated and cherished. "Society would be very dull if every man resembled the highly estimable Marcus Aurelius or Adam Bede." What eugenics aims at is to put every class at its finest; to make each sort more and more conform to its best specimens. Only so can the general tone be made better. And social salvation lies in improving the average quality. As Mr. Galton says, if public leaders will insist upon "playing to the gallery," we must give them a better gallery to play to—one that will hiss vulgarities and savagery off the stage, instead of frantically applauding them. In this view the social philosopher is at one with the poet, whose prayer was

> "O God, make no more giants;
> Elevate the race."

The subject is one of tremendous importance, and the first thing is to get people to believe it so. Mr. Galton is under no illusions. He is well aware of the common ideas and practices related to what John Fiske termed "that stupendous process of breeding which we call civilization." Better conceptions must begin with the educated and the serious. Eugenics must be an academic question before it can come to be a matter of intense and general practical interest, or be finally, as Mr. Galton hopes it will, "introduced into the national conscience like a new religion." If it is a noble thing to produce a race in which sound physiques, strong minds, and good morals are in widest commonalty spread, to debase the stock is surely a national disgrace. There is, however, no surer way to debase it than to follow rash counsels looking to number rather than quality.

The aim throughout is to give richness to life. And here those who hold to the rabbit theory of national well-being have to face the fact that it is precisely the most intelligent and conscientious parents of our time who think so much of the happiness of the coming generation that they will not improvidently bring children into the world. They would hotly resent Mr. Roosevelt's implication that unwillingness to have large families is a kind of race treason. The real traitors to race are those who would degrade and weaken it by so diminishing the opportunities of a swarming population that discontent and a fiercer struggle for existence will bring the bestial qualities uppermost. What has been called the "apologetic attitude" of the modern father in presence of his child goes well with the more serious weighing of the responsibilities of parenthood. It is really a wholesome, not an alarming thing if people are thinking with deeper intentness about the desirable restrictions on marriage and about the laws of health and happiness as related to the bearing and rearing of children. To give one well-born and correctly brought-up son to the commonwealth is to serve it better than by burdening it with a half-dozen ill-conditioned boys. What the ultimate destiny of the human race may be we do not know; but the duty which lies next at hand for this generation is to study and disseminate the laws of heredity, and to so act upon the knowledge of them, with a due regard to the environment in which children are to be placed, that the level of health, intelligence, and morality shall be at least a little raised.

THE EDUCATION OF CRŒSUS.

In the baccalaureate sermons of Sunday our college graduates and undergraduates, together with their "subsidiary parents," received a large quantity of exceedingly sound advice. There is no vice which they were not warned to shun, or virtue which they were not urged to cultivate. We cannot but wish, however, that more of the preachers had turned aside from the routine exhortations of the season to discuss a pretty serious question which is treated in a recent issue of the *Harvard Graduates' Magazine*—the difficulty of dealing with our rich youth in school and college.

At the dinner of the New York alumni last winter Professor Lowell complained of the danger from too much luxury showered upon undeserving sons by thoughtless fathers. Professor Baker has taken up the theme at length, and described conditions which exist, not merely at Harvard, but in some other Eastern colleges as well. The complaint lies against "a number of attractive, pleasant lads," who "show a remarkable and genial imperviousness to lasting impressions which do not connect themselves with athletics or possibly society." Their talk, "except on athletics," is "self-centred and meagre. These men do not necessarily take so-called soft courses, but they develop a surprising capacity for drifting courteously through any course with the minimum of labor and permanent result." Professor Baker also remarks that as a matter of fact the concentration of the attention of these men has brought small results in general athletics to-day, as compared, say, with ten years ago. In short, they are wealthy and agreeable loafers, interested in nothing but athletics, and good for nothing, even at that. The natural taste and incapacity of this group is emphasized by their gregarious habits. They herd together in palatial private dormitories. "The scale of expenditure is set by the very wealthy," and there is accordingly a strengthening tendency toward "segregation on a money basis."

For these evils various remedies have been proposed. Professor Lowell would have new dormitories so equipped as to strike a mean between the bareness of the old and the luxury of the new. The "stiffening" of courses might also help; but then the rich boy could hire a tutor, for his notion is that study is a curse, to be borne "manfully, with such mitigations and solace in the way of tutoring as one's purse will permit." In suggesting still another remedy, Professor Baker lays his finger on a very sore spot, the attention of college faculties to the higher degrees rather than to the knotty problems of instruction offered by large freshman and sophomore classes, the development of the specialist and the investigator rather than the highly skilled teacher, the man who might seize and inspire some of these indifferent lads with genuine enthusiasm for study.

Most thoughtful persons, however, will agree with Professor Baker that the cause of the trouble lies far too deep to be reached by any of the specifics yet proposed. Dormitories, discipline, and didactics are all well enough in their way; but they hardly touch the underlying conditions—the attitude of the boy's own family. For in extravagance, in lack of taste, in total apathy as regards the mind and soul, the college student is simply the product of the atmosphere in which he has been reared. It is not to be expected that young Mr. Pork Packer or Copper King will in a few months forget his home training, if that fine phrase may be applied to the precious lessons in manners and morals learned from ignorant servants and subservient masters. He will carry with him to New Haven and Cambridge his mother's desperate desire to break into society at any cost, his father's contempt for mere bookmen. The young hopeful knows that the easiest and shortest road to social standing lies through a "swell" fitting school and college. There, if his conduct be not too outrageous, he will form the acquaintance of the sons and daughters of people who would never dream of associating with his impossible parents. With a practically unlimited letter of credit from "the old man," with his clothes, his horses, his automobiles, and his yachts, with his lavish support of the athletic teams, he and a company of his kind may, without falling into the grosser vices, dazzle and demoralize half a college class.

To combat a general movement is a difficult and disheartening undertaking; but this is exactly the task that lies before those college graduates and undergraduates who do not wish to see our strongholds of learning taken by the Philistines. There has never been a time when sober fathers and mothers, when the sane and saving remnant among their children, were under such heavy obligations to maintain their ideals of restraint in expenditure and simplicity in living; to stand as a bulwark against a new irruption of barbarians; to spread the wholesome doctrine that college is the most unfitting place in the world for indulgence in the lust of the flesh, and the lust of the eyes, and the pride of life.

THE CRUCIAL TEST OF A PLAY.

Mr. W. J. Courthope, the cultured historian of letters, and Mr. Walkley, the dramatic critic of the London *Times*, have been running a bloody tilt to decide a question old and still forever new. Said Mr. Courthope incautiously in his 'History of English Poetry': "The crucial test of a play's quality is only applied when it is read." Whereto the watch-dog of the *Times* replies that "such a canon is absurd on the face of it," and that "actual stage-performance is the only true and proper test of a play's quality." Mr. Courthope retorts that the writer for the *Times* has fallen into the base blunder of ignoring the point at issue, which point he reiterates. As an illustration of his thesis, he asserts that in their own age Fletcher was a more popular dramatist than Shakspere, whereas to-day the latter still holds the stage, while Fletcher's plays cannot be revived. "Obviously," he says, "the theatrical spectators of his time did not apply the crucial test which settles the standing of Fletcher in the dramatic literature of our country. Not less obviously, I should have thought, the reasons for the difference in quality between Shakspere's plays and Fletcher's must be judged by the literary critic in the reading."

That is as pretty a quarrel as one could wish in these piping times of peace. It reminds us of that battle of the two knights which used to be related in our school-readers, when all good things were in those books. "The shield is of gold," says the one. "Silver," cries the other, and straightway they fall to blows, not having perceived that a shield has two faces. It would seem to a looker-on that both Mr. Courthope and Mr. Walkley are right, and, contrariwise, both wrong. Certainly, the test of a play, in so far as it is designed for the stage, must be whether it will act and how it will act. And the reason why Shakspere holds the stage better than Fletcher is, we opine, the very simple reason that he acts better. On the other hand, considered as literature, that play is certainly best that best endures the test of reading.

What Mr. Courthope seems really to have in mind is a somewhat different question: his words would imply that a play considered as a piece of literature is something higher and capable of giving higher pleasure than a performance on the stage, and here he has with him the taste of the finer critics. What we see acted before our eyes is more realistic and stirs the passions more profoundly to terror and pity; but those rarer delights of reflection that lead the mind from a word or a phrase to roam over wide fields of fancy—all these are lost by the hurry of the scene and the limitations of the actor. A strong imagination may perhaps escape the tyranny of the senses and leave a man to dream his own dream, while the vision of

> "Thebes' and Pelops' line
> And the tale of Troy divine"

is passing unobserved before him. Emerson, we know, went once to see the Hamlet of a famed performer, and all he then heard and all he could remember of the tragedian was simply Hamlet's question to the ghost:

> "What may this mean,
> That thou, dead corse, again in complete steel
> Revisit'st thus the glimpses o' the moon?"

With those magic words his imagination was carried out of the theatre and beyond the reach of the actor's voice. Hamlet was literature to him, and the performance nought.

Dryden, too, little given to dreaming as he was, seems to have found a finer pleasure in the reflective pleasures of the closet than in the coarser and more emotional appeals of the stage. But the classical example of this form of taste is Lamb, to whom, curiously enough, neither Mr. Courthope nor Mr. Walkley has

alluded. "It may seem a paradox," writes Elia in that great essay, "but I cannot help being of the opinion that the plays of Shakspere are less calculated for performance than those of almost any other dramatist whatever. Their distinguishing excellence is a reason that they should be so." Lamb does not mean quite what his words assert. He was fully aware of the acting excellence of Shakspere's dramas and of the hold they might exercise over the unvisionary crowd, but he was also aware of hidden depths of meaning and aerial fancies that no actor could reproduce and no common audience could appreciate. He knew that, beside the drama of action which could be presented on the stage, there ran, as Maeterlinck has so subtly observed, a parallel drama not meant for the eye or the ear, but for the heart of the few who had experience of the inner life. And he thought these silent exultations of the reader nobler than those more obvious joys of the listener:

"The state of sublime emotion into which we are elevated by those images of night and horror which Macbeth is made to utter, that solemn prelude with which he entertains the time till the bell shall strike which is to call him to murder Duncan—when we no longer read it in a book, when we have given up that vantage-ground of abstraction which reading possesses over seeing, and come to see a man in his bodily shape before our eyes actually preparing to commit a murder, . . . the painful anxiety about the act, the natural longing to prevent it while it yet seems unperpetrated, the too close pressing semblance of reality, give a pain and an uneasiness which totally destroy all the delight which the words in the book convey, where the deed doing never presses upon us with the painful sense of presence; it rather seems to belong to history—to something past and inevitable, if it has anything to do with time at all. The sublime images, the poetry alone is that which is present to our minds in the reading."

This is something different from the bald statement of Mr. Courthope that the crucial test of a play is in the reading. It leaves room for the common-sense view of Mr. Walkley that the proof of a drama, as drama, is in the acting; and it permits us to hold, further, that the drama written deliberately for the reader alone is likely to be a failure even in the closet, because it bids the reader visualize in fancy what cannot take form. The crucial test of a play as literature is, after all, simply this: that it must be at once powerful on the stage and fascinating in the closet.

THE SHADOW OF STEVENSON.

Robert Louis Stevenson died between eight and nine years ago, and yet his shadow still lies heavy upon the pages of our amateurs in literature. In admiration of Stevenson as story-teller, letter-writer, and essayist, we yield to none. We even include in our list of delectable reading a considerable part of his verse, especially that in the 'Child's Garden.' But a fondness for Stevenson, which the severely critical might regard as inordinate, cannot persuade us that his worst writing is better than any one else's best; that every word from his pen is more precious than rubies, and that the sure road to success is imitation of his mannerisms.

Shakspere and Milton stand on an eminence that makes the least scrap of their work interesting and significant. Of Burke it has been said, with a show of truth, that the only fair sample of his style is everything that he wrote. A lost magazine article by Shelley—"beautiful, ineffectual angel" though he be—would be worth rescuing from oblivion. But those who toil on the lower levels cannot, either by the attraction of their personality or the intrinsic merit of their utterances, compel any such recognition. Thackeray is a greater than Stevenson, and yet the publication of volume after volume of his waifs and strays, hasty and fugitive compositions which he was glad to forget, has added neither to his reputation nor to the edification or amusement of the public. There are plenty of men alive to-day whose pot-boilers are quite as trivial and inconsequent as Thackeray's. Why disinter buried rubbish for the benefit of an age that has surpassed all others in the production of this undesirable commodity?

On this score Stevenson himself entertained no illusions. When he was collecting the material for the Edinburgh Edition he frankly told his friends that he would leave out some of his more immature work; he would not, he declared, fill the barrow with green apples. The soundness of his judgment has been abundantly proved by his superserviceable disciples, who have reprinted essays and sketches which he and the rest of the world would willingly have let die. No rival of William Morris can start a private press without publishing, as evidence of his zeal and taste, some paper by Stevenson that should have remained in decent obscurity. The ardent collector of Stevensoniana may buy this stuff; but even he must acknowledge that all the glory of hand-made paper, deckle edges, wide margins, and the other stigmata for which a bibliomaniac hunts, cannot make the booklet worth shelf-room.

These reprints are a bore, but yet more tiresome are most of the books, essays, and poems about Stevenson. The time for lyrical laments has probably passed. Soon after the death of Stevenson, Richard Le Gallienne seized the psychological moment—whatever that may be—and with the help of a threnody lifted himself into the public gaze; but a wise fear of being classed with Le Gallienne has doubtless stopped the mouths of other aspiring poetasters. Friends who can boast of more fervor than discretion, however, have laid bare the life of Stevenson from the cradle to the grave. If any one has further details about Stevenson in Scotland, Stevenson at college, Stevenson in London, Stevenson in Belgium, Stevenson in France, Stevenson in New York, Stevenson in the Adirondacks, Stevenson in California, Stevenson in Hawaii, Stevenson in Australia, and Stevenson in Samoa, we beg him to withhold his hand and graciously to spare us.

Our most terrible pest at present is the young littérateurs who are forming themselves upon Stevenson, and are consequently writing in a style that would have driven him either to suicide or justifiable homicide. These hopeful youths have made a profound study of Stevenson—often in college—and they know the precise proportion of nouns, verbs, adjectives, color-words, and figurative turns to put into their mixture. Aware that the charm of Stevenson's essays lies in his personality, they are giving us large doses of their own personality. They, too, have a "cheerful philosophy of life" which they take as seriously as if they were the author of the Twenty-third Psalm. They labor under the delusion that it is something of a feat to write with what they call "individuality." They seem to forget that anybody with a strong right arm and no dread of ridicule can turn out at the rate of a column an hour such platitudes as these:

"In this crowded world, where every man touches the elbows of his fellows a thousand times a day, each soul dwells incommunicably alone.

"Though friendship be the treasure of time, love is the treasure of eternity.

"Let us rid ourselves of conventions and speak eye to eye and heart to heart, deep answering unto deep.

"There are three things no power on earth can shake; the mountain on its granite base, the glittering pinnacle of heaven, and the faith of a woman in the man she loves."

But it is a pity to spoil even wood-pulp paper with such inanity. A personality is always charming when it is charming; but nine hundred and ninety-nine times out of a thousand it is deadly commonplace. In most cases, then, the field for the display of it is either manual labor or those humbler forms of composition, such as editorial writing, that demand nothing more than energy and good intentions.

A VICE-PRESIDENT FOR MEXICO.

MEXICO CITY, May, 1904.

What is described by Mexican editorial pens as an "imposing manifestation of the sovereignty of the people" and something to "make the heart swell with patriotism," has just taken place in all the capitals of the States and the Federal District of Mexico, in connection with the proclamation by *bando* of some new amendments to the Constitution of this so-called Federal Republic. To one who comes from a republic where, when the Constitution is changed at all, it is usually done by the slow movement of the course of events in the minds of the people, or else by some undemonstrative but epoch-making decision of the

supreme judicial body, it is interesting to note how more frequent changes are brought about in a republic where even the mere formal ratification of amendments by the legislative power is made secondary to the display with which the Executive puts in force governmental changes which it has itself in fact originated.

First, the Federal Congress having ratified the Constitutional amendments which were formulated by the Federal Executive, they are submitted to the Legislatures of all the States. Their ratification in these bodies, which are under control of the central authority at Mexico City, just as the entire Governments of the States are so controlled, is a mere matter of course, quite as was their ratification by the Federal Congress, which is under the eye of the Executive at the capital. In this case the ratification was unanimous. The Secretary of the Interior in the Federal Government thereupon communicates the amendments to the Government of each State, in the form of a proclamation beginning: "Porfirio Diaz, Constitutional President of the United States of Mexico, to the inhabitants thereof, Know ye: That the Federal Congress has been pleased to issue the following decree," etc., and ending with the usual flourish: "Liberty and Constitution." The official gazette of each State thereupon bulletins the document, which might be considered sufficient to make it law. But the Executive in Mexico has invented a little extra - constitutional process which is designed to make the process of changing the Constitution rather more impressive.

In each State capital the detachment of Federal troops and all the constabulary force (Diaz's prized *rurales*) which can be mustered, are brought forth in the demonstration with which the Constitutional amendments are proclaimed. They set out at early-breakfast hour on Sunday morning, their triumphal passage through the streets having been announced by a half-hour's strenuous battering of all the bells of all the numerous churches (there still survives enough of the feeling against the old clerical party in the hearts of the Governmental liberals and their successors to make them delight in forcing this recognition of authority out of the churches on all purely national holidays). A body of buglers on horseback precedes, and there follow the troops a few carriages with the civil officers of the local Government. Wherever the buglers and the column halts, the new amendments are proclaimed to the assembled peons on the street-corners, who have not the least idea as a rule what the *bando* is all about, much less what the Constitution itself is; and, if possible, the proclamation is pasted up in a conspicuous place. The proclamation is done by the civil authorities, but the important side of the procession is the soldiers and the *rurales;* the masses may not know what the Constitution is, nor care, but they know what the troops are, and whom they represent.

The same ceremony was gone through in Mexico City, only in more splendid style, as a whole brigade of troops was there turned out. The show of the Executive was therefore even more imposing in it all, One was reminded of what occurred at the recent execution of a soldier in one of the prison-barracks of the capital. Few spectators were admitted, and, some cry of pity or murmured comment having arisen when the man declared his innocence, a sergeant of the army stepped forth and proclaimed: "In the name of the Republic, listen: Who raises his voice shall suffer five years of imprisonment." A new way of imposing punishments by proclamation.

The new amendments to the Constitution, which has now become all patched over with amendments, mostly relating to details, since its first promulgation in 1857, are designed to accomplish two things, viz.: to provide for the election of a Vice-President and his succession to the President, and to extend the Presidential term from four to six years. When Diaz is re-elected this year, therefore, it will be to serve until December of 1910. It would appear that the question of a successor to him was far enough in the future to make discussion over it rather academic. Still, he is a man now past seventy, and it is well understood that the provision of this year for a Vice-President is designed to open the way for some one to step quietly and naturally into his place in case he should die, or should make the proposed vacation-trip to Europe, or should fill out his full term and then retire, as is expected. The logical nominee for the Vice-Presidency, under this view of the case, is generally felt to be the able minister of finance, José Limantour. The latter, however, seems to have somewhat of the objection that is felt at times in the United States to becoming a Vice-Presidential nonentity, especially as he is very much interested in the work he has in hand of reorganizing the country's monetary system and of reorganizing also its railways under governmental control. Then, too, the older men among Diaz's adherents, who do not stand quite with the younger "progressives" in all their measures, have their candidates for the place.

The readiness to create again the post of Vice-President, after it has lain in "innocuous desuetude" for over thirty years, is significant of the feeling that there is no longer any danger in constituting an official successor to the President. In the early days of the republic, almost every Vice-President promptly began to conspire against the President, raised an army in his particular stronghold of the country, and marched to the overthrow of the administration in which he was nominally second member. Hence the revision of the Constitution to do away with the office which is now restored. It is felt that the day of such conspiracies and rebellions is past; if not wholly obviated by the change in sentiment of the people, at any rate the railroads and the telegraph lines of to-day make it impossible to raise mutinies as they once were raised.

It was not generally known in the United States that Diaz had any opponents at all for the Presidency in the election of 1900, and it was supposed that the show of opposition to him succumbed in 1896. In putting himself forward for the Presidency this year, however, Señor Nicolas Zúñiga y Miranda says that he was an opponent of Diaz for the office both in 1896 and in 1900; it does not appear, however, that he figured in the final returns with any votes. According to his autobiography, he ran for the Presidency in 1896, when he was not yet of the legal age, thirty years. It appears from the same document that he is the typical sort of agitator whom Spanish-American countries further south know so well. When fifteen years of age, he claims, he initiated the popular "strike" against the use of the new nickel coins then introduced, which "strike" began at Zacatecas, his home, and which did lead to the withdrawal of the new coins; his claim as to the origin of the affair, however, hardly agrees with the records of it. At the age of sixteen, it appears from his statements, he "made various studies and published some in astronomy, meteorology, natural sciences, hygiene, chemistry, philosophy, etc. This made him more popular, not only in this country, but also abroad, where many of his studies were reproduced." We are informed also that he has made a most profound "study" (in written form) of all the constitutions of the whole world, beginning with the Romans, but this unfortunately has not yet been given forth to the waiting public. At the age of seventeen, while studying law, he represents himself to have been the chief opponent of the recognition of the English debt. He appears to have been very much of the "opposition" always, and to have suffered imprisonment several times upon the charge of sedition. It is hardly necessary to say that his candidacy will not figure much in the ordinary newspapers of the country; he is issuing a little folio of his own in which it is presented, with the signatures of the alleged "notables" who endorse him.

Such is "popular government" where the "people" does not know that it rules, though designated in the liberal press always as "the sovereign," or else with a capital P.

CYRENE.

ROME, May 10, 1904.

So much of what is known and thought about Cyrene is dependent on explorations carried out many years ago, that an account of the present conditions of the city may be of interest. Roughly speaking, the northern coast of Africa was in ancient times divided into three parts—Egypt, the Cyrenaica, and the country under the control of Carthage. Of these regions the Cyrenaica is still but little known even to travellers and archæologists. Until recently the difficulties consequent on the nature of the country and the character of the Arabs have hindered the progress of study. The last person to visit the site was, I believe, Mr. Weld Blundell, an Englishman. This was some eight years ago, and he, I have been told, met with such trouble at the hands of the Arabs that he was forced to hurry his departure. At present the conditions are favorable to the scholar. The city is unquestionably difficult of access, for the ancient port, Apollonia, the present Marsa Suza, is not called at by the steamers that ply along the coast; its handful of population depending on overland connection with Bengasi, five days to the west, or Derna, two and a half days to the east. At neither of these places is there a proper harbor; so, not infrequently, passengers to these ports are carried past their destination, owing to the north or east winds preventing a landing. I was fortunate in not having to take this chance, being on board Mr. Allison Armour's yacht *Utowana*, a boat well known to many

students for the scientific trips her owner-captain has organized.

Our party consisted of Mr. Armour, Mr. D. G. Hogarth (one-time director of the British School at Athens), Messrs. Van Buren, Curtis, and Cross of the American School in Rome, and myself. Our minister in Constantinople, Mr. Leischman, had obtained for me, among other letters, one to the governor of Bengasi from the minister of foreign affairs in Constantinople. The weather and other reasons made it, however, necessary for us to go first to Derna, where, on explaining our purposes and showing various official letters, the Vali gave us a letter to the Captain at Marsa Suza. We did not wait long at Derna, but went at once to our destination, where we found desolate surroundings, but a most hospitable welcome. Landing early in the morning, we accomplished the inevitable coffees and compliments as quickly as courtesy would allow, and then set to work to find animals to carry us and our pack over the twelve hilly miles that separated us from Ain Shehat or Cyrene. Two horses, a donkey, and a camel were all that could be collected; and, mounted on these, with an escort of seven soldiers, we started.

Marsa Suza itself is full of interest to the archæologist, there being many tombs, a theatre, temples, and churches, all offering a rich field to the excavator. The present town consists of some forty families of Cretan refugees, and about thirty-five soldiers. It has a good water supply, brought by open aqueduct and ditch from a fine spring which breaks from the rock about two miles away, and the soil seems pretty good. The road to Cyrene leads southwest across the plain that stretches from the sea to the first terrace of the hills, which are reached in about half an hour. It climbs this terrace by a steep zigzag, which follows the line of the ancient road, the "paved" road that Battus built, the rock-cut bed of which is plainly visible a large part of the way to Cyrene. From the top of the terrace, about 1,000 feet up, one looks back at the sea with its harborless coast for the last time till Cyrene is reached. From this point the trail continues over a rocky plateau, through woods of rather low and heavy growth, for some seven or eight miles to the foot of a second terrace, on the heights of which are the ruins. But, though wooded, the verdure did not seem to me in any way worthy of the praise bestowed on it by most writers. Doubtless, conditions were very different anciently, but it is not surprising, considering the lay of the land, that the early settlers discovered the rich uplands of Cyrene only when led thither by natives; nor is it to be wondered at that, after the desert regions surrounding Cyrene, travellers, both ancient and modern, have been strongly impressed with the pleasant woods and fields of the city itself.

It is evident that the road in old times was passable for wheeled traffic, and Smith and Porcher, to whose excavations in the middle of the nineteenth centry we owe a great part of our knowledge of the city, found it possible to carry the spoil they collected down it to the sea. At several points along its course are remains of Hellenistic or Roman post and guard houses; and, what with its steep grades and the impassable ravines on either side of much of its length, it must have been easy to defend. After following it perhaps three miles, and while one is some four miles from the city, the country changes into rolling, fertile upland, in the main covered with woods, but with, considering the region and the people, a surprising amount of grain, which increases steadily as one approaches the city.

The first sign that the city is nearby are scattered sarcophagi by the roadside; then, a little further on, appear rock-cut tombs and buildings of all sorts; but it is not till at the foot of the last ascent up the second terrace on which stands the city, and about four hundred feet below the ancient acropolis, that one perceives one is approaching a very remarkable site. It is only then can be seen how the two hills on which the city was built have been carved into scores of terraces, each of which is crowded to its utmost capacity with tombs. Tombs of all sizes, tombs of all ages, tombs of every kind, carved into the back of each terrace, having Doric and Ionic façades; single and multiple tombs, some with inscriptions, some without them; and then sarcophagi cut in the solid rock and not carved separately but made by the rod, merely sawn apart at the ends and left connected at the bottom. It is the most impressive view of a necropolis I have ever seen. Those at Makri, or Myra, or Xanthus in Asia Minor are nothing to it.

Zigzagging up through these fields of the dead, the old road takes its way till it reaches the modern settlement, which is to the north of the Fountain of Apollo and on the eastern of the two hills. Here we found another very friendly young Turkish official, who, with four or five soldiers, is occupied collecting taxes. His house is built on and in one of the tombs, and this is the general custom; there are scarcely any houses, but every one lives in a tomb. Probably this has been the custom for hundreds of years, and accounts for the scantiness of the traces of the old world that the tombs offer. However, in one which was being cleared for habitation while we were there, some Roman vases were turned up, and it is scarcely to be doubted that careful search would disclose many unopened graves, especially of early date, for the Greeks of the time when the city was founded did not delight so much as their descendants in having their tombs visible. Just where to search for the earliest necropolis is not easy to say. Of the three main groups, the two already mentioned and another in a valley to the west of the acropolis, it is the latter that presents the oldest architectural forms, but the long life of the city has brought about a puzzling juxtaposition of early and late types.

The best guide to the ruins is still Smith and Porcher's map, though the cultivation of the ground since their day has caused some disappearance of buildings visible to them. The Stadium, for instance, and the temples to the north and west of it, and the reservoirs to the south, are as clear as can be, but the two smaller of the theatres are not so evident. Smith and Porcher were, however, digging rather for the sake of loot than with any scientific object, so that the ground as a whole still maintains the secret of the use and purpose of many of the shattered mounds of ruins that one sees, and the relation to the city of the streets, the direction of which can still be traced. Where was the palace? where the agora with the tombs of Battus and the early kings?

I have already referred to the two hills on which the city was built—Pindar's "white breasts of swelling earth." They are spurs of a high plateau facing north. At their foot stretch rich fields, splendid ground for the horse-breeding and agriculture that brought the city wealth. Behind them to the south reaches back indefinitely and solitary the Dark Continent, and it is as one's eye roams over this view from the top of the western of the two hills (which, notwithstanding Studnicska's arguments, no one who has been there can doubt was the acropolis) that one gets the most impressive suggestion of the ancient life. Far away east, south, west, over the dry plain, speckled here and there with herds of goats, reaching out to the palpitating horizon, are ruins: tombs above ground, others built round courtyards beneath the surface, reservoirs, forts, temples, churches, the broken records of a very great city. They extend for miles over the plain, and silently make clear that in her day "the divine city of golden-throned Cyrene" was a mighty centre of wealth and civilization. On the acropolis itself, called Grennah by the Arabs (in which form the name Cyrene still lives), there is little. On its northern slope is the fountain whose constant waters give life to the gardens just below around the *tekke* of the Senussi Arabs, and these small patches of cultivation are all that is left of the "pleasant gardens of Aphrodite." It would take some weeks to explore the region thoroughly, but a short visit suffices to make clear the richness of the site for excavation. Our country takes, comparatively speaking, so very little interest in such work that it can hardly be hoped American scholars will have the chance of emulating the work already done by English and Italians; but success, to whomever falls the undertaking, will largely depend on being tactful with the natives.

RICHARD NORTON.

BARON HUEBNER'S DIARY.—I.

PARIS, May 19, 1904.

The diary kept for nine years, from 1851 to 1859, by Count von Hübner, Austrian ambassador in Paris, may be in many respects considered an historical document. It is equally a social document, as it introduces the reader to the highest society of Paris at the time, as well as to the official world, which was in those years entirely apart from the aristocratic world. The diary, just published under the title of 'Neuf Ans: Souvenirs d'un Ambassadeur d'Autriche à Paris sous le Second Empire,' has a portrait of Count von Hübner, in his ambassador's costume. The likeness is perfect, and shows well the man as I have seen him, with his inquisitive eyes, his dry face, his thin and compressed mouth with its defiant and ironical expression. The diary is published by the son of Baron Hübner, twelve years after the latter's death, according to a wish expressed by the defunct. "These souvenirs," says the editor, "are not memoirs in the proper sense of the word, but a mere journal, to which are consigned the events and the diplomatic transactions in which my father took such a great part in his quality of

Austrian ambassador in Paris under Napoleon III."

The epoch over which the published diary extends was fertile in events, and we will name first the end of the Second Republic in France, the *Coup d'État* of the Second of December, the proclamation of the Second Empire which followed it, the recognition of this empire by the great European Powers, the marriage of Napoleon III. with Eugenia de Montijo, the complications of the Eastern Question which ended in the Crimean war, the first movements of the revolutionary party in Italy, the attempt of Orsini upon the life of Napoleon, and the impending war of France and Austria in Italy, which put an end to the mission of Baron Hübner. All these events belong to history; but what the reader will look for in the diary are the writer's judgments upon persons, his psychological study of the actors on the stage of history. The diarist is interesting also in himself. A representative of the old Roman Empire, which was then still in existence, of the most conservative power in Europe, he found himself cast in a country still convulsed by all the passions which found full play after the Revolution of 1848.

The diary begins on January 4, 1851. The year was filled with the development of the antagonism between the National Assembly and Louis Napoleon, who was the President elected by the direct suffrage of the people. The President took the command of the army of Paris out of the hands of Gen. Changarnier, who was the favorite of the Assembly and of its leaders, Molé, Dupin, Thiers, the Duke de Broglie, Berryer, Montalembert, and Odilon-Barrot. Thiers was the real chief of the parliamentary coalition. Hübner, as an Austrian, was very hostile to parliamentary government. Speaking of Thiers, he says: "He has rarely spoken with more talent and cleverness. If you wish to see to what a degree parliamentarism decomposes society and degrades men and things, read, study, meditate his speech." At that time Thiers was "high Tory," and Hübner exclaims: "Quel caméléon!" On the 2d of December he writes:

"At eight o'clock in the morning my valet enters my room; the streets, he says, are full of troops; the National Assembly is militarily occupied. A bad headache does not hinder me from traversing Paris and from sending to Prince Schwartzenberg two telegraphic dispatches and a long report. Princess Lieven, though still in bed, receives me to exchange her news with mine. Later in the day her salons resemble headquarters. The information sent by the parliamentarians crosses that sent by her friends of the Élysée. Going home in a mild rain, I find the Louis XV. bridge barred, and am obliged to make a détour. Buol, who was waiting for me at the Embassy, begs me to go to the diplomatic dinner, set for to-night, which has not been countermanded notwithstanding the events of the day. The town has the peculiar aspect of a military revolt. It reminded me of Lisbon on a pronunciamento day. . . . The President went along the boulevards on horseback. There was no demonstration either for or against him."

Hübner relates with great exactitude all that fell under his eye on the days which followed the 2d of December. On the 4th the position seemed critical; the arrest of so many Deputies, some of them very popular, displeased the *bourgeoisie*.

"The Government, having no enemy before it, is very much embarrassed. If the situation of yesterday and the day before continues, its position will be untenable. . . . The faubourgs seemed little disposed to offer or to accept battle. They prefer to fatigue the soldiers and to indispose them towards the enterprise by marches and countermarches which lead to nothing. One begins to doubt the success of the *Coup d'Etat;* at the Ministry of Foreign Affairs they don't conceal this from us."

The situation changed all at once in the afternoon of the 4th: "Suddenly, without any apparent reason, the soldiers at several points fired upon the passers-by on the boulevards, on the balconies and the windows." In a note Hübner says: "Who gave the order for the troops to fire on quiet people? It has never been learned. It is one of the most sinister traits of the conspiracy which placed Louis Bonaparte on the throne of France."

On leaving the salon of Princess Lieven, on that eventful day, Hübner went from the Rue St. Florentin to the Boulevard, which he followed as far as the Rue de Grammont with Count Buol. There they were separated by the crowd, "and I could see," he says, "a platoon firing almost *à bout portant* on the group in which Buol was. Fortunately, he was not hit." At the Union Club, where Hübner took refuge, the windows were broken by firearms. Princess Lieven metamorphosed herself rapidly into a friend of the Élysée, though her parliamentary friends had been for the greater part arrested. Guizot remained in a corner, alone and deserted. "What amuses me is the candor with which the Princess confesses her versatility and the *sans-gêne* with which she shows it."

Hübner was not long in judging the situation. On the 8th of January, 1852, he writes:

"The country is thirsting for authority; it drains with delight the cup offered it by the Government of the sword. It consoles itself, if it needs consolation, by saying to itself that the nation made its own choice of master. The parliamentarians do not try or are unable to conceal their consternation; yesterday they were sovereigns, to-day they sink into nothingness. . . . The President is master of the country. So far, his star has served him well. His power is founded on the army. 'With the army, through it, for it,' must become his device. He is master of France by right of conquest; or, rather, France has fallen into the trap laid by him and his accomplices. . . . 'Vox populi, vox Dei' is the sum of his political creed. I like to see in him thus the instrument chosen by Providence to strike on our Continent the mortal blow to parliamentarism."

Hübner shows here his absolutist bias. He was a partisan of authority; but it did not suit his ideas to see authority at the mercy of a popular vote. He was quick to discern the real affinities of Louis Napoleon. After the plébiscite which gave eight millions of votes for the restoration of the Empire, he goes to a ball at Saint-Cloud. He finds the company rather mixed. "Democratic forms and ways are not, however, to the taste of Louis Napoleon. But, a product of universal suffrage, he cannot deny his origin, and he must even brandish it. But this costs him little. . . ." They talked on the recognition of the Empire by the courts:

"Napoleon spoke with great frankness, and listened to me with marked attention. Only it is always the same thing. He speaks well, and sometimes with a true or simulated abandon, but he never takes up the arguments presented to him. He does not know how to discuss. His cold gaze, which at times is lighted by a flash, his motionless features, form an impenetrable mask; one always leaves him with the impression of not having been understood by this apparently obtuse mind, in reality perspicacious, which does not understand because it does not wish to understand, or because it will not have you perceive that he has understood you."

Elsewhere he writes:

"All eyes are fixed on the elect of the people. One scrutinizes his features, which say nothing; his eyes, which are sleepy and no more eloquent than his lips. If he opens those lips, it is to utter banalities. During his presidency, before the *Coup d'Etat*, the parliamentary leaders taxed him with stupidity and ignorance. When he spoke, or rather stammered, for the first time, Montalembert exclaimed: 'Why, this is the speech of a Swiss!' He has risen in rank: they don't call him a fool; they call him a sphinx."

Hübner saw very early through the sphinx; he felt that the Emperor meditated great changes in Europe, and he constantly warned his Government. Buol wrote to him to try to hinder Napoleon from calling himself Napoleon III.; he would not hear of the 15th of August being a national festival, as in the time of Napoleon I. "The 15th of August is not the feast-day of Louis Napoleon, nor of his uncle; it is the anniversary of the birth of the man who was the torment of Europe, and whom she placed at the bar of nations." Hübner answers: "I understand and share the legitimate indignation which the sovereigns feel at what is going on here; but I feel the duty of reporting the situation as it exists." He represented the danger of a war with France. He knew that England would give in; one after the other, the sovereigns of England, of Prussia, gave to Napoleon the title which he claimed. The marriage of the new French Emperor with Doña Eugenia de Montijo was the occasion of many interesting comments. Hübner met her for the first time at the house of Gudin the painter:

"Doña Eugenia, though pale and fatigued, was in high beauty, but overexcited to a degree which struck everybody. Two days ago the Emperor asked for her hand, but only to-night does the secret begin to transpire. After dinner, I had a long talk with the future Empress; she is very seductive."

Correspondence.

OUR NAVAL WAR CODE.

To the Editor of The Nation:

Sir: In the *Nation* of May 26, p. 403, apropos of recent incidents of the war in the Far East, you comment upon the employment of floating mines from the point of view of international law, and cite "our own Naval War Code recently issued." Allow me to call your attention to the fact that the Naval War Code, which was published with the approval of the President "for the use of the Navy and for the information of all concerned," on June 27, 1900, was revoked by the same authority on February 4, 1904—on the eve of the outbreak of war between Japan and Russia. I enclose a copy of the Navy Department's general order of that date.

Very respectfully, Frank Marble,
Lieutenant, U. S. Navy.

Navy Department, Washington, May 30, 1904.

Notes.

By a slip of the pen last week we disguised the name of the Rev. Samuel M. Crothers, who is to prepare the biography of Dr. Holmes for Houghton, Mifflin & Co.'s American Men of Letters series.

The Golden Treasury series of Macmillan Co. has just been enriched by a volume of 'Poems by Thomas Campbell,' selected by Lewis Campbell, who supplies a discriminating introduction, notes, and index of first lines, and an early portrait. Campbell's verse in small part has never ceased echoing. Mr. John Bartlett, in the last edition of his 'Familiar Quotations,' allowed him 42 items, filling four pages; two-thirds of these are little likely to recur nowadays in literary usage, but the other third may well be familiar a century hence.

Ginn & Co. add to their Standard English Classics the 'Essays of Charles Lamb,' competently selected and edited for schools by Professor Wauchope of South Carolina College. He has wisely done more than reproduce the "Essays of Elia," and the general reader will be glad to have, besides, the essays on Hogarth, Shakspere, and the Elizabethan Dramatists.

We have received from J. B. Lippincott Co., Philadelphia, the first 'Social Directory of Greater Pittsburgh,' compiled by Margaret A. Winans, and very liberally and handsomely printed.

Almost anything might be gathered under the title of 'A Dictionary of Names, Nicknames, and Surnames, of Persons, Places, and Things,' such as has been compiled by Edward Latham (E. P. Dutton & Co.). It is, in fact, one more "reader's handbook," of 334 pages in double columns, with no great sense of proportion in the several entries. Some lines of selection can be made out, *e. g.*, the names of the several religious denominations. Though of English provenance, the work does not neglect the United States, and perhaps we can give no better idea of its scope than by enumerating a few rubrics: *America* (the yacht), *Monitor* (the ironclad), *Hassler* expedition, *Liberator* (the newspaper), Liberty Enlightening the World (the statue), Hub of the Universe, Queen City, Tammany Hall, Molly Maguires, Fugitive Slave Law, McKinley Act, Sherman Bill, Edmunds Bill (anti-polygamy), Omnibus Bill (Clay's), Old Hickory, Old Zach, Rail-splitter, Great American Traveller, Hartford Convention, Sheridan's Ride, etc. So far as we have observed, the definitions are accurate.

Under the somewhat unpromising title, 'The Dread Inferno,' Longmans, Green & Co. have published a little volume, by M. Alice Wyld, which merits hearty commendation. Its modest sub-heading, "Notes for Beginners in the Study of Dante," gives no adequate idea of its scope: it is in reality an admirable preface to the whole 'Commedia,' although it deals nominally only with the first part. After a brief but thoughtful Introduction, it tells the story of the "Inferno," explaining fully and clearly its allegorical significance and its relation to the later *cantiche*. While the author is evidently an accomplished scholar, she makes no display of barren pedantry, but dwells constantly upon the universality of Dante's message and the directness of his appeal to a modern reader.

Mr. Arthur Henry, whose experience in 'An Island Cabin' aroused some interest, now transports us to the Catskills, and relates the construction there of 'The House in the Woods' (A. S. Barnes & Co.). While it is exasperating to read of any one's making such stupid blunders as are here narrated, a pleasant impression is produced by the account of the virtues of Mr. Henry's neighbors. A great part of the book consists of conversations in the vernacular, and the style seldom rises above the commonplace. The interest of the story lies chiefly in the description of the manner in which practical difficulties in building were surmounted.

It might seem that the public was sufficiently informed concerning industrial combinations, but Mr. H. C. Richie has been moved to add to the list of books on the subject one entitled 'Trusts and the Public Welfare' (New York: R. F. Fenno & Co.). Mr. Richie presents no new facts, furnishes little verification for his figures, and, as he appears to be a protectionist, is naturally unable to suggest any novel remedies for the evils that he deplores, unless we regard seriously the proposition that only corporations of small capital shall be allowed.

What may be called the political socialism of the present day is the subject of a work by R. C. K. Ensor, entitled 'Modern Socialism' (Charles Scribner's Sons). Very little space is given to the theories of the earlier Socialists and the systems of doctrine which they developed. Instead of these rather dreary and obsolete discussions, Mr. Ensor gives us selections from the writings of men actively engaged in carrying out socialistic principles in government. The extent to which socialism is applied in practice is now very great in England — the country where the Socialists as a party figure least. In the English colonies the experiment has been tried in its extreme form; but in some of the European countries municipal socialism has made much progress. These selections are very impressive in their showing of the extent and force of the tendency to increase the functions of government. They throw little light on the effect on the quality of government of its enlarged responsibilities.

Volumes X. and XI. of Miss Hapgood's translation of Turgeneff (Scribners) contain the short stories printed in Vol. V. of the Russian edition. Among them are "The Inn" and "The Two Friends," which, as a correspondent pointed out in the *Nation* for April 21, do not appear in Mrs. Garnett's version.

Parts 24 and 25 of the 'Catalogo Generale della Libreria Italiana 1847-1899' (Milan: Hoepli; New York: Lemcke & Buechner) still do not exhaust the prolific letter P. *Progetto* and *Programma* are among the longer rubrics. Silvio Pellico is a very lively classic, and fills one and a quarter pages to Petrarch's one and a half. A character comedy, published in Milan in 1871 and in Florence two years later, is entitled "Le Prigioni di Boston," and might be worth examination by the curious. The foreign contingent in these two fascicles is noticeably small. Quite the biggest gun is Ponson du Terrail, who appears to have struck the Italian chord very true. Translations of his works fill a page, and have been going on from 1858 to 1898. For a like period, 1857-1894, this may be said of Prévost's 'Manon Lescaut.' Poe's Tales took hold of the Italian fancy in 1869, and show four issues in the double decade following; his "Raven" and poems generally were adopted in 1890-92. All Prescott's historical works have been translated, 'Ferdinand and Isabella' in 1847-8, 'Philip II.' as late as 1866; but, naturally, once for all in each case.

Volume VI. of the new output of 'Meyers Grosses Conversations-Lexikon' (Leipzig: Bibliographisches Institut; New York: Lemcke & Buechner) finishes the letter E and nearly exhausts F (Erdeessen—Franzén). Geography, Europe, France, the telephone, fortifications and their reduction, fire service and insurance, fish-hatcheries and fixed stars, are some of the more important articles. There is a useful alphabetical table of inventions in which America figures well in the front on the practical side, with Fulton's Hudson River steamboat, Edison's incandescent lamp, Bell's telephone, Morse's telegraph, and the Atlantic Cable (credited to Cyrus Field in the biographical sketch of him in this volume), Goodyear's vulcanization of rubber, Howe's sewing-machine, the Remington typewriter—enormous gifts to the world. Here we observe the panorama credited to Du Crest, and its improvement to Breysig in 1792. Dr. Murray, in the latest instalment of the Oxford Dictionary, assigns it to Robert Barker, who took out his patent in 1787, but with a French designation—"la nature à coup d'œil." Some two years later he hit upon the name panorama. Barker's biographer in the Dictionary of National Biography notices the disputed origin of the idea. As the universal language Esperanto appears to be taking some hold in French scientific publications, we call attention to the account of it here. There are numerous maps of Europe in many aspects, four of France, two of Frankfort and its environs, and one of Florence, to mention a part. Add the customary cuts and full-page illustrations in black-and-white and in colors.

The garden of South America, according to Col. G. E. Church in the *Geographical Journal* for May, is the extensive region where Brazil, Bolivia, and Peru meet. Unequalled in fertility and natural resources, its trade is still carried on every year with "greater loss of health, life, and material than an active military campaign, and the human suffering is appalling." After describing the three main routes by which the rubber, its principal product, is taken to the ocean, he briefly sketches the boundary disputes which have prevented the construction of roads and railways. These, however, are apparently terminated by the treaty signed last November, which "goes far towards making the grand inland reservoir of the Amazon an international sea, to be used in common by all the republics which have rivers flowing into it." A railway is immediately to be built by Brazil with a branch into Bolivia, and both countries are to make use of it with the same privileges and tariffs. Any disagreement as to the demarcation of the new boundary lines which the two governments cannot adjust, is to be submitted to the Royal Geographical Society for arbitration. Mr. C. Russell gives an interesting account of a journey in eastern Mongolia, in which he says that the most striking peculiarity of the people "is their

indifference to money, for which they seem literally to have no use. They place all they have at the disposal of the stranger, but no payment is expected." Peculiar also were the natives of whom Capt. Maud tells in his description of his journey to explore the East African and Abyssinian frontier territory. One tribe not only is without clothing, but builds no huts of any sort. "Rain causes them no more inconvenience than it does an antelope."

The *Annales de Géographie* for May opens with a discussion of the province of medical geography to-day. With the discovery of the causes of contagious diseases the special interest in their geographical location ceases. Instead, therefore, of volumes containing these geographical facts, such as have been recently published, a series of maps is all that is necessary. Commercial geography is represented by a suggestive study of the four great Atlantic ports of France, this first part being devoted to Nantes and Saint-Nazaire. The aim of the writer is to show the causes of the failure of these ports to secure a larger ocean traffic—their total annual tonnage being less than that of Marseilles and far inferior to that of Antwerp and Hamburg. The main cause is apparently the lack of the industrial development of the towns themselves and the adjacent country. This creates a situation best described by a French shipowner: "Too many mouths, no stomach." Marseilles, for instance, has become a manufacturing city, while Bordeaux is content to remain simply a seaport. Other articles are one upon some place names in the valleys of the Moselle and the Meuse, and an historical sketch of the iron industry in the department of the Haute-Marne—an industry which, fifty years ago, held the first rank in France, but has now almost ceased to exist.

"Raubwirtschaft," or the taking from nature without making a return, is the subject of an informing article by Dr. E. Friedrich in *Petermann's Mitteilungen*, No. 3. This robbery of nature, he remarks at the outset, is a characteristic, not of savages, but of the peoples most advanced in civilization. Several illustrations are given of the care shown by ignorant natives in preserving their food supplies. The cutting down of a cola-tree is forbidden by the chief of the Gold Coast negroes; the Australian savage may not kill birds or destroy nests. Then follows an account of the manner and extent to which civilized peoples exhaust their natural resources, mineral, agricultural, and animal. A geologic sketch of Kamchatka, by Prof. K. Bogdanovitch, is more than a mere summary of the scientific results of his year's exploration. Much information is given in regard to the country and the people, and there is a graphic account of crossing a mountain pass in winter, during which the expedition was buried in the snow for two days. Topographic and geologic charts of unusual excellence accompany the paper.

A lively discussion of the great walls of Babylon is being carried on in the journal of the German Orientgesellschaft between Dr. Koldewey, the leader of the Society's excavating expedition in Babylon, and Dr. Delitzsch, its president. More exactly stated, the point at issue is the course of the two walls, Imgur-Bel and Nimitti-Bel, so frequently mentioned in the inscriptions. Koldewey claims to have found these on the chief hill of the city, the Kasr; the Imgur-Bel being the wall of the so-called South Castle and the Nimitti-Bel that of the North Castle immediately adjoining, which was fortified by Nebuchadnezzar. Delitzsch maintains that Koldewey has made the precincts encircled by these walls entirely too narrow. He also maintains that the Nimitti-Bel is shown by certain inscriptions to have been older than the time of Nebuchadnezzar. He argues largely, too, on philological grounds.

The Société des Antiquaires de France, the oldest and largest archæological society in the country, has just celebrated its first centennial, the meeting being held in the Louvre, with Paul Durrien as president. Among other works in honor of this event is the publication of a magnificent archæological volume entitled 'Livre d'Or.'

In consequence of the destruction of so many valuable manuscripts by the burning of the Library of Turin, the Academy of Inscriptions and Belles-Lettres in Paris at its last meeting decided to have photographic reproductions made of the most important manuscripts under its charge, so that in case of a loss of the originals at least these copies would be preserved. This resolution was taken at the earnest solicitation of men like Salomon Reinach, Paul Meyer, and Dieulafoy. A bill has already been introduced in the Legislature to set aside the sum of one hundred thousand francs for this purpose, to be applied first to the use of the public libraries of France.

For the International Archæological Congress, which has been called to meet in Athens in the Easter season of 1905, arrangements are being made on an extensive scale, and an exceptionally large number of important questions will be brought up for discussion. The arrangement committee expects to secure favorable action on the publication of a bibliographical Annual of Archæology, international in scope. Then an Ephemeris of Greek inscriptions is to be issued, on the model of the publication of the same character dealing with Latin inscriptions, but fuller and to appear more promptly. Especial efforts are to be made to secure the publication of a comprehensive collection of Greek inscriptions in more handy form and cheaper than the great Berlin Corpus. The proposed collection of Christian and Byzantine inscriptions is practically the same as the Corpus Inscriptionum Christianarum planned by a number of French scholars. Another matter suggested by the arrangement committee is the introduction of archæological instruction in the secondary schools.

—With deep regret we announce the death of Dr. Robert Porter Keep at Farmington, Conn., on June 3 of pneumonia. A more genuine scholar or earnest and enlightened educator is seldom to be met with. He had just passed his sixtieth birthday, and was looking forward to a fresh career of usefulness as head of the famous school for girls bequeathed to him by his aunt, the late Miss Sarah Porter. Graduating from Yale in 1865, he was from 1869 to 1871 United States Consul at Peiræus, conformably to his interest in the Greek language and antiquities. From 1876 to 1885, he was teacher of Greek in Williston Seminary at Easthampton, Mass., and from 1885 to 1903 head of the flourishing Free Academy at Norwich, Conn. This position he abandoned in order to return to his birthplace and take charge of the Farmington School. The new responsibility was aggravated by a dissension in the teaching force which led to a serious secession, and to partisan animadversions in the press which belied his simple integrity. For such wrangling he was ill fitted, and he preferred to bear in silence, keeping straight upon his path. His personality was full of gentleness and mellow sweetness, in grain fine above the common, of high tone and aspiration. Soon after he was established at Easthampton he became a contributor to the *Nation*, and such he remained, if intermittently, to the day of his death. The last review from his pen was that of the Life of Edward Bowen in our issue of May 26 (No. 2030). His best-known work is his Homeric Dictionary.

—The leading article in the *Atlantic*, in food for thought as in position, is the paper by John H. Denison on the "Great Delusion of Our Time." The delusion in question is the idea that the scientific progress of the past century has given us the final criteria of truth, putting us in an intellectual position in comparison with which the great intellects of the past are to the thinkers of our day as pygmies to giants. Mr. Denison applies to this conceit the touchstone of our success in dealing with the great social problems of our time, showing that the most advanced thinkers among those who would treat such questions by the methods of physical evolution, have nothing better to offer us than the theory of war to the death for the upper hand—the primitive philosophy of the Troglodyte. The second instalment of Ruskin's correspondence with Professor Norton reveals him for the most part beating his wings ineffectually against the many bars which shut him off from the paths he would have followed. In this period of doubt and depression it is interesting to find repeated tributes to the helpfulness of the writings of Lowell, with which Professor Norton kept him supplied from time to time. "I have written your initials and mine in the two volumes of Lowell (how delightful the new prefaces to the Fable!). He does me more good in my dull fits than anybody, and makes me hopeful again. What a beautiful face he has!" Col. Higginson, for once detaching himself from the great social interests of his life, contributes a readable paper on "Butterflies in Poetry." It must be due merely to a slip of memory that we find no mention of Lowell's "Fountain of Youth," with its yellow butterflies wavering over the goat's-beard and asters,

> "Like souls of dead flowers,
> With aimless emotion
> Still lingering unready
> To leave their old bowers."

—The beginning of Mrs. Humphry Ward's new novel, "The Marriage of William Ashe," in the June *Harper's*, gives the editor the text for some interesting paragraphs on Mrs. Ward's place in contemporary fiction. She has shown, he thinks, a distinct and steady progress away from mental specialties toward the catholicity which is now a striking feature of her work. In her fuller development, the instinct for pure art leads her to such self-detachment as will allow life to utter itself after its own patterns, whether native or conventional. Mrs. Ward's choice is to deal with the conventional, showing

her readers human life in its structural harmonies, not searching down nearest the soil for her characters, as George Eliot and Thomas Hardy. Her appeal, then, we are told, is distinctively to the "polite"; and the large audience which she has built up is almost a proof that culture itself has become popular, using the word in its best sense, and not as applied to the "popular" books which make such a display in the marketplace. And yet she gets close to nature in her own way. The deeply passionate heart is there, the elemental note is heard, though modulated by the conventional forms of refined modern society. Professor Lounsbury continues his studies in English usage with a paper on the expressions *had liefer, had rather,* and *had better.* Mr. Swinburne contributes a six-page poem on "The Altar of Righteousness," not very easy June reading for the literary man, but well calculated to draw the fire of the theologian.

—In its table of contents the June *Century* certainly "makes a record" in number of entries, the different items, large and small, aggregating fifty. This is due to the determination of the editor that each State and Territory west of the Alleghanies shall be represented in a distinctively Western issue, a generosity not likely to be appreciated in every instance. Doubtless Utah, for example, would have been better pleased to be passed over in silence, just now, than to find the longest article in the whole number devoted to her "peculiar institution." Mormonism has been so thoroughly ventilated, both in its good points and in its bad, that the writer of this particular paper, Mr. Ray Stannard Baker, can hardly be blamed for his failure to bring out anything new. Ohio contributes several plums to the pudding, most noticeable among which is a sonnet by John Hay, "Thanatos Athanatos," set in marginal decorations by R. Weir Crouch, and confronted by a fine reproduction of Sargent's portrait of the author. It may be safely said that the critic does not live who could read these supposed locally representative productions without the names of the authors and assign to one-half of them their correct geographical distribution. The mixing agencies are so great that almost any production in the list before us might readily have been produced by any one of many widely separated localities. Solon H. Borglum is included as "a sculptor of the prairie," but his artistic ambition did not lay hold of him seriously during the years of his prairie life in Nebraska. He was born in Utah, and his serious study of sculpture has been pursued first in California, then in Cincinnati, next in Paris, and still later among the Indians of the Crow Creek Reservation in South Dakota. All in all, the *Century* has demonstrated rather the growing cosmopolitanism of all parts of the country than the local peculiarities of any. Our literary democracy bids fair to be relentlessly true to its theory, and develop its brains equally in all parts of its body.

—The distinctively Western number of the *Century* is strongly supplemented in the other leading June magazines. Reuben Gold Thwaites contributes to *Scribner's* an article of sixteen pages on the recently discovered personal records of Lewis and Clark, with illustrations from the documents themselves, and from family relics, supplied by the present owners, Mrs. Julia Clark Voorhis and Miss Eleanor Glasgow Voorhis of New York city. The few extracts given from this new material amply justify the assertion of Mr. Thwaites that it is aglow with human interest The find is especially opportune, since it makes it possible to give to the world practically all the original records of the expedition in time for the Lewis and Clark Centennial, to be celebrated in Portland, Oregon, in 1905. Henry Loomis Nelson, in *Harper's,* endeavors to characterize "the Middle West," in distinction from adjoining regions. The democracy of this section, he thinks, is more real and impressive to those who like democracy, and at the same time more oppressive to those who do not. At heart, however, it is essentially sound, and a product of which no one need feel ashamed. It is here, we are told, that one finds the largest aggregate of the comforts, conveniences, and luxuries of everyday life. An Ohioan will hardly know what Mr. Nelson means by the statement that the New England town meeting, along with the New England prayer meeting, has moved onward through the Mohawk Valley and settled down in Ohio and the neighboring States. The prayer meeting was effectively transplanted, but the town meeting never got its roots into vital connection with Ohio soil. In the *Atlantic* we get a bit of the West in detail, in Meredith Nicholson's appreciative study of Indianapolis. It is essentially a city of homes and home-loving people, we are told; exceptionally prosperous on the average, but not so dominated by millionaires that the owner of a quarter of a million cannot be called rich. Its people are cultivated, yet simple; able to read their Emerson or Browning in the evening, and yet not too proud to go into the public marketplace next morning and pick out their own yellow-legged chicken for dinner. The city has not aspired to catch the quick pace of Chicago, but finds its kindred spirit rather in Baltimore, Washington, or Hartford. We are somewhat puzzled over the story of an Indianapolis Federal judge, who had the habit of locking the door of his office to the end that some attorney, calling on business, might listen to an Horatian ode. Are we to find the explanation in the fact that an Indianapolis judge loved Horace, or that Indianapolis attorneys would listen to Horace only under lock and key?

—It was a happy thought to notice the centenary of the death of Alexander Hamilton by republishing in handsome form and in a limited edition William Coleman's 'Collection,' first issued in 1804. The Burr-Hamilton duel will always possess a romantic interest from the characters of the men involved, and the tragic ending has blinded us to certain defects in Hamilton's qualities quite as much as it has emphasized the evil side of Burr's reputation. The bitterness of political conflict led the greater man to exert his high abilities in disrupting his party, and thereby hasten its permanent defeat; the bitterness of political disappointment led Burr to seek vengeance against the man who had been so powerful an opponent, and whose very existence meant a closure of all avenues of preferment in State and national administration. The shock given to the community is reflected in this Collection, which was compiled by a friend and warm admirer. "I have lost my best earthly friend, my ablest adviser, and my most generous and disinterested patron," said Coleman, who wished to show his gratitude by defending Hamilton's memory against the attacks of his enemies, and "to silence the voice of calumny forever." The extravagance of panegyric is noticeable throughout, but the sincere grief of a friend excuses much, and the general horror expressed at the needless sacrifice of a brilliant career through a barbarous custom gives the compilation a social value apart from the personal. Bishop Seymour of Illinois is responsible for the reprint, and Houghton, Mifflin & Co. are the publishers. A table of contents and an index should have been inserted.

—While the total attendance at the twenty-two German universities last term was 37,881 regular students, at the fourteen French universities it was 30,405. Of this number Paris alone reports about two-fifths, namely, 12,948. In Germany there is no such preponderance of a single institution. Berlin, indeed, leads with an enrolment of 7,503, but Munich is a good second with 6,609, and Leipzig closely follows with 3,772. These constitute the three great German universities; only one other, Bonn, with 2,294, passing the two thousand mark. After Paris come in order Bordeaux, with 2,320; Toulouse, with 2,191; Montpellier, with 1,707; Nancy, with 1,327; Rennes, with 1,190; Lille, with 1,164; Aix-Marseille, with 1,081; Dijon, with 880; Poitiers, with 863; Caen, with 752; Grenoble, with 705; Besançon, with 333; and Clermont, with 299. According to faculties, the distribution in the French universities is as follows: 10,972 in the law department, 6,686 in the medical, 4,765 in that of natural science, 4,384 in the philosophico-philological, and 3,014 in the pharmaceutical. The total number of foreigners is about two thousand, while Germany, for the same term, reports 3,114, showing that the systematic efforts put forth by the French during recent years to attract foreigners have only partially succeeded. In both countries the Russians head this contingent, being 973 in Germany and 450 in France. Rather singularly, in France the next on the list are the Persians, with some 200, nearly all in the medical faculty. In German universities the Persians are practically not represented at all, the small Asiatic enrolment being chiefly Japanese. The Turks also seem to prefer France to Germany, the numbers being respectively 371 and 113. The opposite is true of the Americans, for Germany claims 321, and France only 57. The enrolment of women is practically the same in the two countries, being 1,129 in France and a few more in Germany. Of the 448 non-French women nearly all are Russian. The newly organized universities in France, which came into existence through the law of 1877, and which have always had up-hill work to hold their own against the educational centralization in Paris, complain that matters have been made worse by the new arrangements according to which the École Normale in Paris, formerly an independent school, has now been made the pedagogical seminary of the Paris University. In the Paris *Siècle,* Professor Clédat of Lyons protests against this innovation, as it takes away from the Faculté des Lettres in the

provinces their best students. He fears that the present educational policy of the Government will, in the course of time, mean the destruction of the provincial universities.

EDWARD FITZGERALD.

The Life of Edward FitzGerald. By Thomas Wright. In two volumes. Charles Scribner's Sons. 1904.

Nearly a generation has passed since the death of Edward FitzGerald. In the early eighties he was known to a very few discriminating persons as the translator of Omar, and to many more as the intimate friend of more famous men, such as Thackeray and Tennyson, and Spedding, the editor of Bacon. That the reputation of FitzGerald has gradually disengaged itself from the second-hand immortality of affectionate references in the biographies of others, is mainly due to Mr. Aldis Wright, who in 1889 published his 'Letters and Literary Remains,' following them up with further 'Letters,' including those to Fanny Kemble, and 'Miscellanies,' and finally, in 1903, with the *édition de luxe* of FitzGerald's complete 'Works,' which is likely to remain the standard edition. In his preface to the first series of 'Letters' in 1889, Mr. Aldis Wright remarked that they were a sufficient record of a life that was too contemplative to lend itself to a formal biography. But nowadays Fitzgerald is a popular poet. All who read poetry read Omar; and since "the Philosophy of it is one that, Alas! never fades in the World," Omar is a favorite with many who never look between the covers of any other poet of the Victorian era. Last year died E. B. Cowell, professor of Sanskrit at Cambridge, the only begetter of the English Omar, since but for his influence FitzGerald might never have read Persian. He was the last survivor of the half-dozen friends whom FitzGerald loved so sincerely, saw so seldom, took no trouble to see. That is the time to write a man's life—when no feelings can be hurt, while the memory of his actual personality and habits has not had time to fade.

Mr. Thomas Wright proved his sympathy with the life of contemplation by his biography of Cowper. FitzGerald's personality and his poems are nearer and dearer than Cowper's to our generation, and Mr. Wright might have spared us a good deal of the preface, which insists too much on the novelties that he has to offer, and is as undignified as a publisher's advertisement of the latest sensation. To consider first the new material which he tabulates, he has consulted, as of course any biographer would, a great number of unpublished letters. He has discovered that the original of Phidippus in 'Euphranor' was W. Kenworthy Browne—an identification which he regards as one of the "most interesting revelations" of his work. Browne was very dear to FitzGerald, his ideal man, a country squire not unacquainted with letters, who was possibly, though not certainly, as Mr. Wright affirms, the model for Pendennis. A biographer must not, of course, conceal the weaknesses of his subject, as though he were the hero of a novel. But he should refrain from dwelling on his maudlin moods. Considering what he calls his "vegetable blood," "Fitz" was easily carried away by his amiable tendency to idealize his friends. One of these enthusiasms he lavished on Browne. Mr. Wright, however, quotes nothing to prove that for him this amiable country gentleman was at once "Jonathan, Gamaliel, Apollo—the friend, the master, the god; there was scarcely a limit to his devotion and admiration; and literary history offers no parallel to the conjuncture" (p. 158). In 1859, Browne died from a fall from his horse. Five years later FitzGerald formed an intimacy with the sailor Fletcher, whom he nicknamed "Posh." Mr. Wright is so proud of his discoveries of what really filled that uneventful life at Woodbridge that he devotes sixty-two pages to "The Yacht and Posh" and "Chiefly Posh." If Fitz at sixty was an old fool, we must of course face the fact, but why dwell on it?

From the "thirty-two new anecdotes" advertised by his biographer we select the following about "Posh":

"When Posh was at Woodbridge, no food or drink was good enough for him. On one occasion, after an imperial feast, Alfred Smith being present, Posh felt inclined for a rest and laid himself full length on the sofa. 'Poor fellow,' said FitzGerald, in sincere tones, 'look how tired he is.' 'It seems to me,' said Mr. Smith, 'that you have made him half drunk with your old Scotch ale.' . . . He could scarcely bear to have his 'great man' out of sight. In letters he addressed him as 'My old Stull,' 'My dear old Swiper.' . . . One day a gentleman stepped towards Posh and asked some question about the wind and tide. Suddenly FitzGerald made up to them, and, taking Posh by the guernsey, pulled him away, saying to the stranger, 'This is *my* guest.' 'He made me,' commented Posh, 'to look a complete cake.' So unusual, indeed, was FitzGerald's behavior that many Lowestoft people took him for a madman, and Posh for his keeper."

The chapter which has the suggestive title "Chiefly Posh" is, indeed, devoted chiefly to reminiscences of this dubious sort, reported to Mr. Wright by Mr. Alfred Smith and Posh himself. FitzGerald's disillusion came at last. Posh took to drink, and a rather melancholy situation becomes humorous when one observes the translator of Omar, the poet of the tavern, laboring in vain to convert his fallen idol to the pleasures of total abstinence. Yet, as late as 1877, we must needs be assured, in the chapter on Fanny Kemble, that FitzGerald is "still full of his Great Man and his Great Man's lugger, house, dog, cat, bird, brother, father, mother, wife, and baby" (p. 168).

Mr. Wright does not give his authority for the "discovery" that FitzGerald was in love with Caroline Crabbe, the granddaughter of the poet (p. 163). But his statement in another connection (p. 93) that we shall never know what sort of letters he wrote to her, implies that his evidence is not direct. FitzGerald was singularly indifferent to women. Their society amused him on occasion, and he was on friendly terms with several. The charming verses on the death of Anne Allen, published in the 'Miscellanies,' tempt Mr. Wright to suspect on the part of FitzGerald a feeling more intense than friendship. We quote from this short lyric, which should take its place in Victorian anthologies, where FitzGerald figures as the poet of a small though independent field. He had, in fact, a fairly wide range of poetic activity, and though he thought on the publication of 'In Memoriam' that "the world wants other notes than elegiac now," he could, when he pleased, write such elegy as the following:

"The wind blew keenly from the western sea
And drove the dead leaves slanting from the tree—
Vanity of vanities, the Preacher saith—
Heaping them up before her father's door,
When I saw her whom I shall see no more—
We cannot bribe thee, Death.

. . . . . .

Idly they gaze upon her empty place,
Her kiss hath faded from her father's face:
She is with thee, O Death."

Only one woman left her mark on the life of FitzGerald, and that was the one who embittered the last twenty-seven years of it—his wife. He was born an old bachelor, and born indolent. At thirty-five he takes the tone of a man of seventy: "A little Bedfordshire—a little Northamptonshire—a little more folding of the hands—the same faces—the same fields—the same thoughts occurring at the same turns of road. My garden is covered with yellow and brown leaves. . . . My parsons come and smoke with me." The wish to exert one's self, "the highest wish a FitzGerald can form," he never formed. At forty he shrank from travelling twenty miles. He could only envy the acquisitive and capacious souls of other men. An early marriage, or another woman, might have electrified him into ambition; but he was forty-seven when, against his better judgment and the warnings of his friends, he married Lucy Barton, a formal, conventional old maid, as unadaptable as himself. He thought her no better than a cannibal because she would not adopt his "Lenten fare"; she disliked his slovenly clothes and unsociable habits. Cheyne Row was a dovecote to the FitzGerald ménage. To the proud and sensitive soul of FitzGerald the vulgar contest of wills, the small tyrannies of a fussy martinet, soon became intolerable. An informal separation ended the six months of married life, and though on her visits to Woodbridge he occasionally encountered his wife, they never again exchanged speech. Once, when he and Posh were walking through Woodbridge, "a lady approached them, taking off her glove. FitzGerald said in an undertone with tremor: 'It's my wife,' and, removing his glove, he advanced to meet her. He put out his hand, and their fingertips had all but touched when he turned round suddenly and, seizing the sailor's guernsey, said, 'Come along, Posh,' and they walked silently away."

Literary criticism is not Mr. Wright's strong point. We could have spared a good many of his pages on Persian, Spanish, and Greek literature; on the other hand, we should have looked for a closer psychological study of FitzGerald himself. It is as though he had not realized the contradictions that make the translator of Omar an enigma. Here was a man born and bred in the heavy air of "Silly Suffolk," the Bœotia of England, content with its rather dull and colorless landscape, content to see Italy through Frederic Tennyson's eyes, and India through Cowell's. At the time when he was revising Omar and translating the "Agamemnon," he was absorbed in a sentimental and foolish attachment to Posh. Yet he could sing without a touch of sentimentality about roses and the moon and nightingales—a real triumph for a British poet. He bought bad pictures and was convinced that they were Titians, but he never made a mistake in the coloring of

his words. His imagination was Hebraic under that British surface. His anemones in spring are "to blow Tyrian dyes"; the cliffs cut sea and sky

"As silver scissors slice a blue brocade."

Finally, from the provincial atmosphere of Woodbridge he sent out a picture of the East, its fatalism, its joy of life, its *carpe diem* philosophy that has forever driven out Tom Moore's Persian artificialities and poured a new spirit into the old mould which was cast by generations of disillusioned poets, from Mimnermus down.

Mr. Wright's industry in collecting facts about the mad FitzGeralds and their friends extends to the illustrations, which are numerous and interesting. He has added no less than sixteen appendices, dealing with pedigrees, parish registers, and bibliographies. At the end he reproduces some pages of a commonplace book containing sketches by FitzGerald. The general getup of the book is very attractive. On page 120 Prof. C. E. Norton is spoken of as "of New York," which was true neither in 1873 nor at any other date.

THE PHŒNICIANS AND THE ODYSSEY.

Les Phéniciens et l'Odyssée. Par Victor Bérard. Volume II. Paris: Armand Colin. 1903. Pp. 638.

In this volume Bérard concludes his arguments in favor of the thesis that the Odyssey is a Phœnician *periplus*, or *portulan*, anthropomorphized into a Greek poem. Each of the stories of the poem, according to his view, is simply the development of some phrase found in the original nautical directions for Semitic sailors; and though the poet gave the poem some embellishments, and some literary quality by the choice of words and arrangement of episodes, yet it contains still more exact, scientific, geographical truth. And as the wanderings of Ulysses are based on a Phœnician *portulan*, the story of the wanderings of Menelaus is founded on an Egyptian tale, which reached the Greek poet through the Phœnicians. "The Semite furnished the block of marble; from this the Greek carved the statue." "The poet was a Greek, but Ulysses was a Phœnician." The poet "gave human life and personality to words, things, or beings mentioned in the *periplus*." Thus, the cave of the Cyclops is identified with the "Grotto of Sejanus," the tunnel more than half a mile in length through the rock of Posilipo, of which one sees the mouth on the road from Naples to Pozzuoli. The tunnel was made near the beginning of our era, but our author believes a cavity must have existed previously to suggest the tunnel. The Cyclopes themselves are Oscans, who "may have been cannibals" a thousand years before Christ, and whom strangers naturally would strive to conciliate with gifts of wine, such as Ulysses offered as a libation to Polyphemus. The smoke of the Cyclopes which Ulysses saw from a neighboring island was the fumes from the craters, Solfatara and the rest, which explain also the thick mist about the Achæan ships as they came to land. The little island on which the Greeks landed was Nisida, just off Posilipo, but the story of its being frequented by wild goats was borrowed from Goat Island (*Capri*) across the bay. Polyphemus himself was one of the neighboring volcanoes, each of which, when seen on a relief map, gives the impression of being a round eye. Each crater is independent, like the Cyclopes, and does not disturb its neighbors, but may belch forth disagreeable things and even throw rocks. Thus, one of these volcanoes became a thrower of rocks and a devourer of men, and the poet assigned to it the rude customs of the Oscans. Indeed, it was not wholly anthropomorphized, for the poet says expressly that Polyphemus was "not like to a bread-eating man, but to a woody summit of lofty mountains which appears alone apart from the rest." Our author thinks that a page or two from Achæan pastoral life may have been inserted in this story of the Cyclops and his flocks, but yet perhaps all was taken from the *periplus*.

Similarly, the thunny fishery on the coast of Sardinia is thought to suggest to the poet the massacre of Ulysses' companions by the Læstrygonians, and the chase of sword-fish and sea-dogs on the shores of Sicily was the basis for the horrible deeds of Scylla. In order to leave the grotto of Calypso, Ulysses builds a raft, not a boat, because on the Spanish shores near Gibraltar such barges were used by the natives. The hero is brought twice to the island of Æolus, simply to show first the kindly reception granted when the north wind blows, and second the inhospitable rage of Stromboli with the wind from the south; for Æolus, the master of the winds, is a volcano as well as Polyphemus, and evidence is adduced to prove not only that, in the belief of mariners, Stromboli is a good barometer, but that the activity of the volcano is affected by the direction of the wind.

If the author were an ordinary literary man, and had published his views in a monthly magazine, the reader would doubt either his seriousness or his learning; but his scholarship is beyond question, and the two volumes of more than 1,200 large pages, with more than 240 maps, plans, and other illustrations, leave no doubt that he is in earnest. He is an accomplished scholar, a professed geographer, and an influential writer on political questions. He undertakes to identify every site mentioned in the Odyssey—not merely approximately but exactly, such confidence has he in the poet's strict adherence to the topographical details of his Phœnician authority.

In the first volume of this work, as our readers may remember, he discussed the travels of Telemachus, and endeavored to determine the site of Calypso's island at the foot of Monkey Mountain, just outside of the Straits of Gibraltar, on the African side, and that of the city of the Phæacians, on the west side of the island of Corfu. In this volume, he follows Ulysses on his wanderings, to the land of the Cicones (Marona, opposite Kavala, in Thrace), thence to the land of the Lotus Eaters (Aghir, on the island of Djerba, near the Lesser Syrtis), thence to the island opposite Polyphemus's land (Nisida, near Posilipo), thence to the island of Æolus (Stromboli), and, after a vain attempt to reach Ithaca, to the Læstrygonians (Porto Pozzo, on the north coast of Sardinia), to Circe's palace (Monte Circeo, on the coast between Naples and Rome), then to the house of Hades (on Lake Avernus, near Naples), then, after a brief call at Circe's dwelling, past the rocks of the Sirens (the Galli, just south of Sorrento, in the bay of Paestum), and Scylla (at the Strait of Messina), to the island of the Sun (just north of the harbor of Messina), and to Cape Schiso, just south of Taormina. Thence, of course, to Calypso's island, and finally to Ithaca.

The most obvious criticism on the work before us is that the poem does not afford indications sufficiently distinct to determine the exact geographical position of these sites. Take, for example, the land of the Lotus Eaters. On their way from Troy, as Ulysses and his companions were rounding one of the southern promontories of Peloponnesus, Cape Malea, "the Cape Horn of ancient navigation," the current and the north wind carried them past Cythera, and for nine days they "were borne by destructive winds over the fishy sea," but on the tenth day they came to the land of the Lotus Eaters. Ulysses sent for information three of his companions, who were received hospitably by the Lotus Eaters, and who enjoyed the fruits so heartily that they must be brought back to their ship by force. Sailing thence, they came to the land of the Cyclopes. That the Lotus Eaters dwelt to the south of Greece is clear, for Ulysses was borne by a north wind; but the poet gives no indication either of the direction or of the length of the voyage from their land to that of the Cyclopes. Only a bold scholar would dare to select a particular harbor on the Libyan coast for the home of the Lotus Eaters; the Homeric boat could land on any sandy shore. For the visit of Ulysses to Hades, Bérard follows views which are reported by the geographer Strabo. The house of Hades is taken literally; it is the Grotto of the Sibyl, and the hot spring on the west shore of the Lucrine Lake is Homer's Pyriphlegethon. Ulysses does not enter Hades, but the souls come forth; he sees neither the Asphodel Plain nor the rivers of the lower world. The pit into which he makes sacrifice is outside of Hades. His expedition to Hades has nothing in common with the descents of Orpheus and of Heracles, but is to be compared rather with the evocation of the spirit of Samuel for Saul by the Witch of Endor. The seer Tiresias himself is nearly related to the Semitic Sibyl.

As for Ithaca, our author will none of Dörpfeld's view that the Homeric Ithaca was not the classical Ithaca, but Leucas. A sufficient argument for him is the fact that Leucas is not an island, though it is very much like one, and is represented as such on some maps; but such a scruple does not hinder him from determining a promontory of the mainland of Italy to be Circe's Island, since it looks like an island when viewed from certain points, and the notion of an island may have been transferred to it from some neighboring islands. Similarly, he grants that the rock between Ithaca and Samos cannot have been the Homeric island Asteris "with twin harbors,"—but he finds these harbors on Samos, a mile or two away, and believes the poet misunderstood the condensed statement of the *periplus*. The *periplus* clearly did not state distances, and similarly our author neglects to mark the scale on some of his maps. That, in general, he has respect for tradition, is evident from his accepting Avernus and the promontory of Circe, and the isle of the Sirens, as well as Scylla and Charybdis; but his readiness to depart from tradition is shown by his placing the cave of Polyphe-

mus near Naples, the Island of the Sun on Sicily, and by many other identifications. He enjoys finding fine cattle in the Island of the Sun, goats on Ithaca, and swine near the dwelling of Circe, and Mme. Bérard's photographs present these animals to the reader.

As in the former volume, Bérard makes little use of archæological evidence, possibly because little of this can be offered in support of his thesis. Nor does he make much use of philology in the strict sense of the term. Three times he attempts to amend the text of Homer, but twice violates most openly fixed metrical rules, proposing σύβοτος for βούβοτος (υυυ for -υυ) in Odyssey xiii. 246, and κλειστός for κλυτός (-υ for υυ) in Odyssey xv. 472. He implies (page 608) that the Homeric "language of the gods" may have been Phœnician; clearly ignorant that the words which the poet ascribes to the speech of the gods in general have a perfectly distinct Greek etymology. He gives to the sea god Proteus—whom he thinks to be derived from the Egyptian Prouti, as he thinks Pharos to be connected with Pharaoh—a black wig, which he illustrates from Egyptian customs, but this wig is due to a misinterpretation of Odyssey iv. 402. In general, however, his minor interpretations are exact.

Bérard's interpretation of the story of the Læstrygonians involves more false and forced exegesis than any other part of the work. The Homeric passage offers few difficulties, as it is understood by most scholars. Ulysses on his wanderings comes to this land, where the shepherd, as he drives out his flock, hails his comrade who is driving home his flock—where a "sleepless" man (*i. e.*, one who needs no sleep) could win double wages, one by tending kine and another by pasturing sheep—for near are the ways of night and day. This seems to be based on some one's reminiscences of the short nights of summer in the extreme north, where morning comes almost immediately after nightfall: a man who could work for twenty-four hours in the day naturally would earn double wages. Since Bérard assigns the Læstrygonians to Sardinia, he cannot accept the explanation of short nights and long days. The verse about the ways of night and day is to him only a riddle; the way of night is the road leading to the north, the way of day is the road leading to the south, both of which set out from the same place. The mountaineers of northern Sardinia are tall as giants, and the thunny fishery there, as we have seen, suggests the destruction of the Achæans and their boats in the harbor. That shepherd hails shepherd reminds him of bucolic amœbean verses, and that the Sardinians are noted for their improvisations, and a "sleepless" man is an intelligent, "wide-awake" man, who would gain a double prize in these contests of improvisation which were noted in the *periplus*. The name of the neighboring Corsica is interpreted from the Semitic, as from a root to 'devour' or 'tear.' This suggested to the poet the cannibalism of the king, and also the king's name *Antiphates*, from the figurative meaning, 'tear' or 'contradict.'

Scholars are not likely to accept Bérard's identifications of most of the Ulyssean sites. As for the main thesis of the book, which assumes for the Phœnicians not simply a general thalassocracy, but also a thousand trading posts in the Mediterranean, and a close connection between Phœnicians and Greeks, the evidence gained from the archæological researches of the last thirty years has tended distinctly to limit the sphere of Phœnician influence in Greece. For example, an important work by Maass, published a year ago, seems to show conclusively not only that the Corinthian Melikertes has no connection with the Phœnician Melkarth, which has been universally assumed and acknowledged, but also that no clear traces of the Phœnicians are to be found in Corinthian history; and very recently, in the thorough investigations of Hiller von Gärtringen on the island of Thera, where, according to Herodotus, an early colony of Phœnicians had settled, no Phœnician remains have been found. The problem of the relations between Phœnicia and Greece is one of the most interesting which archæology holds before itself. Dr. Dörpfeld, of the German Institute at Athens, in the hope of contributing to the solution of this problem, has obtained permission to make excavations on the Minoan promontory of Megara, and also in Palestine, but of these excavations no news has come.

The volume before us, like its predecessor, contains a vast amount of detailed information with regard to travel in Greek and Italian waters, with careful study of the winds and routes. For example, of these large pages, 135 are devoted to the kingdom of Ulysses—Ithaca and the neighboring seas and lands—forming a better account in many respects than has been published elsewhere. Many of the 144 illustrations of the volume occupy each an entire page, mostly reproductions of Admiralty charts, and of photographs which are due to Mme. Bérard's skill. The theory is presented in an enticing way. The style is agreeable and the arguments are plausible. The book is provided with an elaborate set of indexes.

Classical philologists in general have reviewed this book rather delicately, manifestly fearing that Bérard's Semitic etymologies might prove to have cogent force sufficient to balance the weakness of his argument when viewed from the Greek side alone, but one of the most competent of Semitic scholars allows the present reviewer to quote the following from a private utterance:

"Bérard's attempts to show the Semitic origin of Homeric names and terms are nearly all worthless. Out of the large number which he gives, there are only two or three (and these long known) which could be called probable; the great majority are flatly impossible. As for his 'doublets,' such as Leucadia=Phæacia, connected with 'the root *bâhăk*' (p. 116), they remind one of the little game in which 'lazy dog' is proved the equivalent of 'autograph letter': a lazy dog is a slow pup, a slope up is an inclined plane, an ink-lined plane is a written page; and so on. This is a method in which there are great possibilities. In the phonetic equations of pages 146 and 380, he has confused two entirely distinct letters of the Semitic alphabet—a blunder fatal to his argument, and one which almost any first-year student would have avoided. On pages 62, 83, 323, 327 he bases his argument on assertions which are absolutely false, and in each case regarding matters about which there is not, nor ever has been, any question at all. On page 76 he says, speaking of the old popular etymologies: 'Les marins de tous les temps ont accepté ces jolis calembours; mais il est impossible de les répéter avec confiance.' This sentence suggests the only possible use to be made of M. Bérard's own etymologies; beyond question, those to whom they should be told are the marines."

Trusts of To-day: Facts relating to their Promotion, Financial Management, and the Attempts at State Control. By Gilbert Holland Montagu. McClure, Phillips & Co. 1904.

As a convenient compendium of facts relating to Trusts—mostly drawn from the Report of the Industrial Commission, made two years ago—Mr. Montagu's book has its value; but as a contribution to the solution of the "Trust problem" it seems to us inconclusive. In his preface he says that the facts "clearly define the Trust problem"; but his definition, as given at page 32, is as elusive as balanced phrases can make it. First he enumerates a class of evils springing from industrial combination, which are said to be "inherent" in every "practical monopoly"—the temptation to *raise* prices, to get discrimination from railroads, to *lower* prices for the purpose of crushing out rivals, to corrupt legislation, and to "depress individual initiative." These evils are declared to be "as alarming as ever," and to them must be added a second class, "likely to be more ruinous than the first." These arise from the "prevalent form and method of organization," and are unscrupulous promotion, over-capitalization, and bad management. From these premises, we reach the "Trust problem," which is stated in the following terms:

"If the Trust deserves to live, the savings of combinations must be found real and legitimate; the first class of evils, flowing from the mere fact of monopoly, *must be proved either self-corrective or able to be corrected by statute*; the second class of evils, resulting from the particular form assumed in the organization of existing combinations, *must be shown to be self-corrective or capable of correction by statute.*"

We have quoted this *in extenso* because it reveals the fact that the Trust problem means so many different things that it is really incapable of exact definition. It is in reality a vague term for a number of evils, real and imaginary, which are supposed to be the growth of combinations of capital, and which present not one, but a variety of practical questions, some of them economic, some of them legal, which can be disposed of by no one answer at all.

Mr. Montagu's book is valuable in throwing light on the subsidiary questions into which the Trust problem resolves itself, and we strongly recommend it for that purpose to our readers. While we by no means agree with him at all points, his treatment of the subject is fair, and, of course, facts are facts. For instance, a great deal has been said as to the tariff being the "Mother of Trusts," because protective duties give the great combinations a monopoly of the home market, while the tariff wall enables them to undersell the foreign manufacturer in his own. The Steel Corporation is thus enabled to sell rails here at $28 per ton, while it is at the same time able to make a profit on sales abroad at $20—the difference, $8 per ton, being tribute levied on American railroads. But it seems that manufacturers independent of the Trust make exactly the same profit. The tribute, says Mr. Montagu, is due only to the tariff, and a combination of companies is no better off in this respect than any one company. Hence, it is not true that the tariff is the *causa causans* of Trusts.

On the subject of "over-capitalization" Mr. Montagu does not appear to us to be

clear. His idea that over-capitalization can be measured by the difference between the par value of a security and the price on the Stock Exchange is open to the serious objection that the latter is always fluctuating, and fluctuates so enormously that the same corporation may by this test be over-capitalized to the extent of hundreds of millions at a given date, and a year or two later the earnings and standing of the concern may be such as to bring the market value to the level of par—or vastly above it. In the latter case the company must be under-capitalized, but we never hear this made a specific ground of public complaint.

There is one great fact underlying the whole Trust problem, to which Mr. Montagu does not to our mind pay sufficient attention. It is that, in spite of nearly fifteen years of legislative attacks, including the passage by Congress of a most stringent criminal statute, under which victories have been obtained in the courts, the process of combination and consolidation goes on practically unchecked, until at the present moment nearly all the great industries of the country are aggregations of smaller industries, as all the railroad systems are aggregations of smaller systems. We may go further than this, and say that much of the restrictive legislation has only hastened the process. It was directly owing to the trans-Missouri decision of the Supreme Court declaring rate contracts between railways illegal, whether reasonable or not, that consolidation was substituted for the previous régime, and the only probable result of the Northern Securities case is that the Northern Pacific Railroad will either remain part of the present system or be diverted to a new alliance.

It cannot be said that Mr. Montagu, or those from whom he derives the information summarized here, has shown any way by which large combinations of capital can be prevented; and indeed, so far from preventing them, a large part of our legislative machinery is steadily at work fostering them. Corporations generally derive their powers from the Legislature of a State, and many States have for years done all they could to induce capital to take out charters of any kind that suited the fancy of the promoters of the enterprise, and this at the very time when other States and the Federal Government were aiming criminal statutes at Trusts. Mr. Montagu points out that the old theory of charter-granting was that the State carefully considered and restricted the powers granted with a view to the public interests; but the modern practice is to pass a general statute enabling any persons to incorporate themselves for any purposes agreed upon—even to the extent of doing all that a natural person could do *ad hoc*. So far as supervision over the scope or utility of the corporation goes, there is little or none. "Over-capitalization," for instance, was one of the things that the State tried to guard against, by compelling the corporation to show money, or money's worth, received for every dollar of its stock. The law has just been repealed, or weakened, in Massachusetts, partly owing to a belief that the State, through the rigidity of its requirement, kept taxable capital out of its borders. The great promoters of Trusts are State Legislatures, and the occasional prosecution of a Trust by the Attorney-General has very little deterrent effect.

Discrimination by railroads and unscrupulous promotion no doubt help on the Trusts, but they should be carefully distinguished from other causes, for no one disputes that they are within the reach of the criminal law. If the authorities had prosecuted some of those concerned in the recent Shipbuilding bubble, there is no saying that some American Whitaker Wright might not now be serving out a sentence at Sing-Sing, with excellent deterrent effect.

The Oil Fields of Russia, and the Russian Petroleum Industry: A Practical Handbook on the Exploration, Exploitation, and Management of Russian Oil Properties, including Notes on the Origin of Petroleum in Russia, a Description of the Theory and Practice of Liquid Fuel, and a Translation of the Rules and Regulations concerning Russian Oil Properties. By A. Beeby Thompson, A.M.I. Mech.E., late Chief Engineer and Manager of the European Petroleum Company's Russian Oil Properties. With numerous illustrations and photographic plates and a map. D. Van Nostrand Co.

Mr. Thompson has been at the pains of preparing a quarto volume of 400 pages, with ninety-three illustrations, many of them photographs, giving all the facts worth knowing concerning the oil fields of Russia. The specially notable fields are all situated upon the Apsheron Peninsula, which juts into the Caspian Sea just east of Baku. Here, for many centuries, a continuous flame of burning gas had been maintained by the Parsees, whither pilgrims have continued to come up to recent years from as far away as India. But the great development of the commercial interests has now rendered the location of the temple undesirable, having transformed the region into one of the busiest centres of activity to be found anywhere in the world.

The concentration of the oil interests in Russia is astonishing. The total area of the oil fields from which most of the oil is obtained is scarcely larger than that of an ordinary township in the United States; and yet for the last ten years this field has produced more oil than the whole United States; and the annual rate of increase in production, until the discoveries in Texas within the last two or three years, has been greater than in the United States. According to the report of 1901, the Russian yield was 85,000,000 barrels, whereas that of the United States was but 69,000,000 barrels. But in Russia the crude oil is much more in use for fuel than in the United States, so that we lead the world in the production of refined oil.

It is somewhat humiliating to our pride to find that in many respects Russia has been a pioneer in devising the most economical methods of production and distribution. She was the first to ship oil in steamers in bulk, by which means it is distributed at least cost throughout the vast areas of Russia which are penetrated by river navigation. At first it would seem that the Russians are behind the times in their method of raising the oil from the wells, since they do this almost wholly by the baling process, instead of by pumps. But, on a study of the situation, it is seen that this process exactly meets the existing conditions. The oil mostly is found in soft sandstone, which readily disintegrates, so that a great quantity of sand comes up with the oil, and would speedily clog any pump that might be used. A considerable portion of the oil, however, is obtained by flowing wells, which are in some cases of enormous extent. A single Baku fountain occasionally yields as much oil as the whole outfit of 25,000 petroleum wells in America. The pressure in the wells may reach as much as 515 pounds to the square inch. In 1901 a fountain well was opened which yielded 4,000,000 gallons a day for a considerable period, and was so uncontrollable that it spread disaster in every direction. The column of oil and sand rose to a height of several hundred feet, throwing the stones and oil in every direction, and causing a total cessation of work over most of the oil field.

"A changeable wind drove the oil alternately to different parts of the field, deluging miles of land, and blackening and damaging every building within its reach. A stiff breeze drove the oil towards Baku, and almost every house in Baieloff, a suburb of Baku, was blackened and soaked with petroleum, including the Russian church, public buildings, and private residences. Oil spray was falling over Baku, three miles away, and sheets of note paper exposed to the air near the railway station at almost five miles distance were spotted with oil particles. The ships in the harbor did not escape, and the gunboats of the Caspian fleet, which are painted white, were blackened and made unrecognizable by the drifting oil spray. Although some 60,000,000 gallons of oil were secured, the high duty payable to the Government, and the enormous demands for compensation from persons who suffered damage—for practically the whole of the village of Baieloff had to be cleaned and the houses repainted—left but little surplus for profit."

Another well in the district flowed incessantly for years, producing in all 240,000,000 gallons of oil. With such a record for this area in the vicinity of Baku, great hopes are entertained of striking other accumulations equally productive over the wide areas of Trans-Caucasia and Turkestan, where indications of oil have been found, but as yet with only trifling results.

William Greenleaf Eliot, Minister, Educator, Philanthropist. By Charlotte C. Eliot. With an introduction by James K. Hosmer, Ph.D., LL.D. Boston: Houghton, Mifflin & Co. 1904.

So great was Dr. Eliot's local reputation, and so affectionate the reverence with which he was regarded by his family and friends, that it is a strange thing that his biography should not appear till now, seventeen years after his death. Few biographies have been written in the meantime of more deserving men. No attempt is made to connect the book with the St. Louis Exposition, but certainly its appearance at this time, if a mere coincidence, is a very happy one, seeing that Dr. Eliot was identified with the growth and progress of St. Louis to a remarkable degree, and, if not the first citizen of the city, was one whose honorable services few could match. New England born, the traditions of the New England pulpit were in his heart and brain, and his St. Louis ministry was that of an early Puritan minister, writ large, so completely

did he interfuse the life of the community with his public spirit, so plastic were its fortunes and its institutions to his hands.

Born in New Bedford, Mass., in 1811, a younger brother of Thomas D. Eliot, whose Congressional career was highly creditable, his college education was in Washington, where his father was chief examiner in the Postal Department. It was as a clerk in this department that young Eliot got his first inkling of St. Louis, whence the postmaster's returns came wrapped in a doeskin, with a copy of the *Republican* containing the dead-letter list. Reading the paper, the boy resolved that if he ever went West he would settle in St. Louis. This was in 1831, and the next year he entered the Harvard Divinity School, graduating in 1833. Among his schoolmates were James Freeman Clarke, William Henry Channing, Samuel May, and Theodore Parker, and Clarke became his lifelong friend. It was Clarke's missionary work in Louisville, Ky., that set Eliot's face towards St. Louis. He arrived there in 1834, when the town was a scrawny frontier settlement. He remained there until his death; until 1873 the minister of the Unitarian Society, for the remainder of his life the Chancellor of Washington University. As a parish minister he was as faithful and laborious as if he had nothing else to do; as a social and civic reformer he was as active and efficient as if his avocations were his only care. Clearly, however, it was his ministerial vocation that was the foundation of his wider usefulness. In the discharge of that, he grappled to himself the men on whom he could rely in any work of educational or humanitarian reform.

Mrs. Eliot's topical arrangement of her matter, taking us over the same years repeatedly in a succession of chapters, is rather confusing, but is, perhaps, the best arrangement possible. The first of these chapters, following one upon the earlier course of Dr. Eliot's ministry, has for its subject public school education. He did not become a member of the School Board until 1848, but very soon his colleagues "knew the difference." Not even the cholera of 1849 slackened the energy of his successful push for a one-tenth per cent. city tax for public schools. Personal acquaintance with the schools was conceived as a part of his duty which he might not neglect. His character had no sectarian taints. When Roman Catholics complained that a Protestant version of the Bible was used in the schools, he moved and carried a resolution that all versions be excluded.

The year 1849 was a terrible one for St. Louis. It was a year of cholera by which the city was literally decimated, a year of flood and fire. In the thick of the cholera epidemic Dr. Eliot confirmed the judgment of Napoleon, that a man who is superior to fear is superior to the plague; his devotion to the sick, the dying, and the dead was of no different quality from Father Damien's with his leprous islanders.

The crown of Dr. Eliot's educational enterprise was his influential and preëminent part in the foundation and development of Washington University. In its inchoate stage it was called Eliot Seminary, and, but for Dr. Eliot's protest, the developed institution would have borne his name. His money gifts to it of more than $100,000 were the smaller part of his contribution. It would be interesting to know how he acquired the means for such beneficence. It was said of him that, if he had devoted himself to business, he would have owned nearly everything west of the Mississippi. The two chapters assigned to his connection with the University are not a line too much. The big name troubled him at first, but he resolved to make the little school a real university, and lived to "see what he foresaw."

There are four chapters corresponding to Dr. Eliot's engagement with anti-slavery and related problems and affairs. He was not one of those whom Samuel J. May included in his list of Unitarian ministers faithful in the time of trial. But if he was not an abolitionist, he was certainly an anti-slavery minister and citizen. In an Eastern parish he would probably have been as abolitionist as the Mays and Clarke and Theodore Parker. He resented the charge of cowardice, and contended that it cost him more to take his line in St. Louis than it would to be an abolitionist preacher in New England—a doubtful proposition. But hardly can it be doubted that his conscientious conservatism gave him a moral leverage in Missouri which a more uncompromising spirit would have annulled. It was the habit of his ministry to arraign slavery in his pulpit; he was an eager advocate of gradual emancipation; he denounced the Fugitive Slave Bill as a statute that should not be obeyed. If two or three times he was actually a slave-owner, it was only to the end that he might break the bonds he held in his own hands. He wrote the life of Archer Alexander, a slave to whose welfare he devoted himself with impassioned interest. It is important, in view of the criticisms, now more current than ever, on 'Uncle Tom's Cabin,' that Dr. Eliot declares it contained nothing which he could not parallel in Missouri, where slavery existed in its milder form.

When the war had actually begun, Dr. Eliot's trumpet gave no uncertain sound. A single sermon diminished his congregation by one-fourth, who, going out, did not return. In constant correspondence with the authorities at Washington, his letters bearing upon the condition of Missouri, the military status of the negro, emancipation, the Western Sanitary Commission, were remarkable for their sobriety and weight, and for the influence which they exerted. During the war Dr. Eliot's position was more advanced than that of his Republican friends. For example, he applauded Frémont's famous order, and saw in it "the beginning of the end." Of the Western Sanitary Commission he was the inspiring soul. In reconstruction problems, especially as affecting the negro, his interest was unwearying. Early in Hayes's Administration he went to Louisiana, and wrote to the President of the Republican domination there in terms of elaborate condemnation. But he failed to see that the enfranchisement of the negro was a horn on which the North could not but impale itself, let come of it what might.

A good chapter is devoted to Dr. Eliot's work upon various lines of social reform, and a concluding one to his sermons and other writings. It is surprising, in view of his average temper, to find him advocating woman suffrage, but the ground is characteristic—"not as a privilege or concession of a right, but as a duty to be imposed." In his theology Dr. Eliot was one of the most conservative of Unitarians, and should have the credit, or discredit, which he does not here receive, of being principally efficient in saddling the National Unitarian Conference with a short but worrying creed, under which it chafed for nearly thirty years. It is interesting and pathetic that this fountain of personal energy was subject to depressing physical conditions, that this fiery soul was lodged in a body singularly frail. It is a daughter-in-law who makes the book, and she has made it excellently well, with no excess of praise; for the most part leaving the unvarnished fact to go for just what it is worth.

Geology. Vol. I.: Processes and their Results. By Thomas C. Chamberlin and Rollin D. Salisbury. (American Science Series. Advanced Course.) Henry Holt & Co.

The high standing of the authors, both as investigators and as teachers, gave assurance, when this work was announced some months ago, that it would be not only accurate and modern in its subject-matter, but thoroughly scientific from a pedagogical standpoint. Anticipation has not outrun realization. Volume I., of 654 pages, deals with geologic processes, and includes not only a study of the forces and processes now in operation, with their results, but also a consideration of the principles governing geologic agencies. It will be followed shortly by Volume II., in which the history of past geologic ages will be outlined. Here the chief topics are: the atmosphere as a geologic agent; the work of running water; the work of ground water; the work of snow and ice; the work of the ocean; the origin and descent of rocks; structural geology; the movements and deformations of the earth's body; the extrusive processes, and the geologic functions of life.

A central feature of the treatment is the effort to keep clearly before the mind of the student the difference between statements of fact and established doctrines, on the one hand, and the less well-founded interpretations based on hypotheses, upon the other. This is particularly the case in the discussion of some prevalent theories which in reality depend upon unverified hypotheses, although the unstable character of their foundations is often overlooked by students and investigators alike. Furthermore, alternative or multiple hypotheses are frequently presented, in accordance with the well-known principle that an investigator is bound to frame and consider not one only, but as many hypotheses as will explain the known facts, and to test each of them fairly in the light of further investigation. In no chapter is this phase of the treatment better illustrated than in that on "The Movements and Deformations of the Earth's Body," regarding which all current theories are based largely upon unverified assumptions. This is not saying that these theories are worthless, for, in fact, they are of great value to the student and investigator so long as the limitation of established fact is clearly recognized. When that is overlooked, as is sometimes the case in text-books, the theories become dangerous pitfalls for the unwary student.

It must be admitted that this mode of treatment has its difficulties on the pedagogical side. It is much easier for the student to grasp one hypothesis rather than

many, to accept one doctrine as established rather than several hypotheses as possible; and there is danger lest even the advanced student turn from the subject with a feeling that the indefiniteness regarding these few topics permeates the entire science, and that positive knowledge can never be obtained. On the other hand, it is essential that a student, even in the beginning, should learn to recognize the limitations of a subject, to discriminate between fact and hypothesis, and to cultivate the critical habit of mind which examines and tests in order to prove or disprove. In our opinion, the advantages of this method far outweigh the disadvantages, particularly when, as in this book, there is no lack of clear, unequivocal statements of demonstrated facts; and the authors are to be commended for the painstaking care with which they have carried out their plan.

Not only is the work to some extent new in its method of treatment, but it is fully abreast of the latest research, as is shown particularly by the discussion of the classification of igneous rocks, the genesis of ore deposits, and those phases of the science on the border-land of geology and physico-chemistry in which there has been such marked progress in recent years.

The illustrations are abundant, wisely chosen, and well executed, and are accompanied by brief explanatory titles. For the most part they are clear half-tones. The presence of small topographical maps engraved in colors and chosen to represent typical areas is a unique and valuable feature of the illustrations.

While the work is intended primarily as a text-book for college students, and will probably be used chiefly as such, nevertheless its readable style, the arrangement of themes, the emphasis laid upon the commoner geologic agents whose activities are so widespread, and the elaboration of the opening chapters, cannot fail to commend the book to any who may be interested in reading the story of the earth. Volume I. has met a real need in college text-books, and Volume II. will be eagerly awaited.

Gerald the Welshman. By M. Henry Owen, D.C.L. London: David Nutt.

The subject of this interesting study is, of course, none other than our old friend Giraldus Cambrensis. Few Britons of any age have possessed more strongly marked characteristics than this spirited and witty son of Pembroke. Born to be a partisan, he fought his way through broils, private and public, during the reigns of the first three Plantagenets, and part way into the reign of the fourth. Among his contemporaries, Walter Map and John of Salisbury may have been more learned and more trustworthy, but, throughout the whole Angevin Empire, no subject of Henry II. held stronger views or was more pronounced in the expression of them than Gerald of Wales. Apart from his enmity towards monks and his dislike of papal aggression, his antagonisms were largely personal, but in his fight for the See of St. David's he at least filled a great part in the life of the Principality. "Many and great wars," said the Prince of Powys, "have we Welshmen waged with England, but none so great and fierce as his who fought the king and the archbishop, and withstood the might of the whole clergy and people of England, for the honor of Wales."

Gerald, however, won his European reputation through letters rather than through politics. This essay of Mr. Owen, though partly biographical, is chiefly critical. The author, who is also the historian of Pembrokeshire, has a natural claim upon Gerald by right of eminent domain, but he brings to the 'Gemma Ecclesiastica' and the 'Libellus Invectionum' tastes which are broader than those of the mere antiquary. Here and there a statement is open to objection. For example, it is said of *Laudabiliter*, "The bull of Alexander has been doubted by Dr. Lynch and others, but it is now allowed to be genuine." Such a sentence as this shows that Mr. Owen is not quite abreast of the latest investigation. There are two separate questions—the Pope's grant of Ireland, and the authenticity of the bull. Mr. Owen seems to think that they must stand or fall together, which, as has been pointed out by Mr. Round and Dr. Thatcher, is by no means an inevitable conclusion. But, for the text of Gerald's own writings, Mr. Owen is very satisfactory. Taking up the Archdeacon's chief works one by one, he shows an intimate familiarity with their contents and with the literature which throws most light upon them. The result is to heighten one's admiration for the best that there is in Gerald, and to beget a considerable degree of sympathy for his foibles. Even when we have allowed full weight to his vanity, garrulity, and carelessness, enough virtue remains to justify a favorable judgment:

"In his pure and noble life," says Mr. Owen, "his hatred of tyranny in every form, his love of nature, his wit and humor, his earnest striving after reform, his indefatigable industry, his chivalrous courage, and his wonderful learning, the figure of the great Welsh Archdeacon stands out across seven centuries, towering above his fellows as he did in actual life."

This, perhaps, is going too far. Gerald of Wales was not an Abelard in genius or a St. Bernard in force; but it is something to rank among the remarkable men of a remarkable century.

Good Books for the Leisure Days

MISCELLANEOUS

OSGOOD'S The American Colonies in the Seventeenth Century

By HERBERT L. OSGOOD, Ph.D., Professor of History in Columbia University, aims to supply the hitherto lacking institutional history of the American colonies. Volumes I. and II., now ready, relate exclusively to the internal organization and relations of the colonies themselves.

Volumes I. and II., $5.00 net. (Carriage 44 c.)

ELSON'S History of the United States of America

By HENRY W. ELSON.

Cloth, $1.75 net. (Postage 24c.)

"In short, we may say that we know of no single volume history that is equal in style, material, accuracy and arrangement to that before us."—*Baltimore Sun.*

"Mr. ELSON has told in one volume just what the ordinary, intelligent reader ought and wishes to know. The book will be especially valuable."—*Public Ledger, Philadelphia.*

"MR. ELSON has a happy faculty of writing history as he would tell a story."—*Boston Transcript.*

WHISTLER as I Knew Him — By MORTIMER MENPES

An extremely entertaining picture of Whistler's extraordinary personality, with illustrations of uncommon interest. There are Mr. Menpes' own portraits of the great artist and reproductions of Whistler oil-colors, water-colors, pastels and etchings.

Over 100 full-page illustrations in color and tint, $10 net.

Mr. EDGAR GARDNER MURPHY'S

Problems of the Present South

A discussion of certain of the Educational, Industrial and Political Issues of the Southern States.

Cloth, 12mo, $1.50 net. (Postage 10c.)

"Of the innumerable books which have been written during the last twenty years on the unsettled questions of the South it is the sanest, fairest, most practical and most suggestive of any we have read."—*The Boston Transcript.*

Dr. WILCOX'S

The American City: A Problem in Democracy

By DELOS F. WILCOX, Ph.D., Author of "A Study of City Government." *Citizens' Library.*

Cloth, 12mo, $1.25 net. (Postage 11c.)

An able, clear account of the subjects of democracy and city life with reference to streets, public utilities, civic education, amusements, popular and official responsibility, municipal home rule, revenues, debt, etc., etc.

THE BEST NEW FICTION

WINSTON CHURCHILL'S The Crossing

Illustrated.

By the author of "Richard Carvel" and "The Crisis," who "has contrived to make his book thoroughly interesting. He paints for us a panorama which embraces all manner of picturesqueness, the cabin of the frontiersman, the stately manor of the aristocrat, the virgin forest and the rapidly growing town. 'The Crossing' is a workmanlike piece of writing, and for that reason, as well as for the interesting nature of the material used in it, holds the attention of the reader from the first page to the last," says *The New York Tribune.*

Cloth, $1.50.

MAURICE HEWLETT'S

The Queen's Quair

"A breathing, moving record made to throb with the red blood of life."—*N. Y. Herald.* *Cloth, $1.50.*

Mrs. KINGSLEY'S

The Singular Miss Smith

"Miss Smith is not nearly so singular as is the fact that this deliciously humorous and witty tale was written by a woman."—*New York Evening Post.*

Illustrated by WILL GREFÉ. *Cloth, $1.25.*

SAMUEL MERWIN'S

The Merry Anne

"Notable for originality, irresistibly clever; an ideal book for vacation reading."—*Chicago Post.*

Illustrated. Cloth, $1.50.

BARBARA'S

The Woman Errant

By the author of "The Garden of a Commuter's Wife," "People of the Whirlpool," etc.

Published this week. Illustrated. Cloth, $1.50.

Published by **THE MACMILLAN COMPANY,** 66 Fifth Ave., N. Y.

Rev. W. G. Thayer, St. Mark's School, Southborough, Mass.
Mrs. Mary Mapes Dodge, 33 East 17th Street, New York.
Robert Bacon, Esq., 1 Park Ave., New York.
Apply to HENRY RICHARDS, Gardiner, Maine.

TRINITY COLLEGE, HARTFORD, CONN.

Comprehensive Library at all times open to students for study in Languages, Literature, History, Economics, Philosophy, Mathematics, and the Sciences.

Thoroughly equipped Laboratories for work in Chemistry, Natural History, Physics, and in preparation for Electrical Engineering.

Courses in Civil Engineering.

Examinations for admission, June 23, 24, 25; Sept. 19, 20, 21, 22. Next Academic Year begins Sept. 22.

For catalogues, etc., address the Secretary of the Faculty.

Mrs. Chapman and Miss Jones
Boarding and Day School for Girls.

For circulars address Miss C. S. JONES,
Chestnut Hill, Philadelphia.

The HIGHLAND MILITARY ACADEMY

WORCESTER, MASS. 49th year. A first-class fitting school for fifty pupils. Home care and comforts. Ideal location, The Rt. Rev. Alex. H. Vinton, D.D., Visitor. Address JOSEPH ALDEN SHAW, A.M., Head Master.

GERMANY, Alsace, Strassburg.

DR. AND MME. CHERBULIEZ receive boys for instruction in German and French.

Teachers, etc.

A WINTER OF TRAVEL and STUDY in Italy and France, for a limited number of young women desirous of studying Art History, History, and Languages. Chaperoned by two experienced teachers and travellers, sailing October 15. Terms $1,000.
Address Mrs. W. A. CAREY,
Miss HELEN G. SMITH,
2117 Green St., Philadelphia, Pa.

AN EXPERIENCED CLASSICAL Teacher, very successful in college preparation, will spend summer on Maine coast near Portland, and tutor one boy in classics and other studies.
Address Dr. D., care *Nation.*

GENTLEMAN will ESCORT PARTY abroad, for expenses. Is teacher, aged thirty, familiar with European travel. References.
N. H., *Nation.*

School Agencies.

THE FISK TEACHERS' AGENCIES.
EVERETT O FISK & CO., Proprietors.
4 Ashburton Place, Boston; 1505 Pa. Ave., Washington; 156 Fifth Ave., New York; 414 Cent. Bldg., Minneapolis; 533 Cooper Bldg., Denver; 80 Third St., Portland; 203 Mich. Blvd., Chicago; 525 Stimson Block, Los Angeles; Hyde Block, Spokane, 420 Parrot Bldg., San Francisco.

ALBANY TEACHERS' AGENCY, 81 Chapel St., Albany, N.Y.—Provides schools of all grades with competent teachers. Assists teachers in obtaining positions.
HARLAN P. FRENCH, Proprietor,

SCHERMERHORN Teachers' Agency. Teachers—Schools—Tutors—Governess—Property. Tel. 6129 18th. JOHN C. ROCKWELL, Mgr., 3 E. 14th St., N. Y. C.

Handy Volume Classics

POCKET EDITION

The Nation.

NEW YORK, THURSDAY, JUNE 16, 1904.

The Week.

Attorney-General Knox as Quay's successor in the Senate is an immense step upwards, mentally and morally. Everybody must agree to that. It is so long since Pennsylvania has had anything but voiceless money-bags and inarticulate bosses for Senators that she will, at first, scarcely know what to think of a man who can frame a policy and defend it. Mr. Knox has distinctly impressed the country with his ability, of the non-explosive kind; and his legal reputation has been much heightened by his conduct of the Trust prosecutions. But just here the political aspect of his appointment insinuates itself. Is he, in effect, a sop thrown to Cerberus by the President? Is the Attorney-General to stand as another instance of the rule that the surest road to employment by the Trusts is to attack them efficiently? For there can be no doubt, Pennsylvania politics being the thing we know, that large corporate interests dictated Mr. Knox's appointment. Are they afraid of him in the Cabinet? Would they like to estop a possible action against the coal-carrying railroads, into whose alleged illegal combination the Interstate Commerce Commission is now inquiring? Such queries will arise.

Attorney-General Knox doubtless speaks by the card when he telegraphs to Omaha that he cannot prosecute the indicted "cattle kings" because of lack of available funds. It would be just like the unscrupulous Democrats, however, to see unworthy motives where there is really nothing but the pinch of poverty. No funds? What about the large unexpended balance of the special fund which Congress voted to bring all the Trusts low? There is a certain deadly frankness about the explanation given by "Republican politicians" in Nebraska. They say that if the prosecution had been pressed and the hated "kings" cleared, the party would have lost at least two Congressmen. If, on the other hand, a conviction had been secured, even the irrigation laws would not have prevented the campaign fund from looking parched. Hence the practical wisdom of putting the cases over to the next term of court—otherwise known as the next term of the President. This is certainly not to "run amuck." It is not even, if the facts are as stated, to walk quietly down the street and do one's duty.

Judge George Gray's dignified abstention from the strife of Presidential candidates did not prevent Delaware from instructing for him last week. In spite of his personal request that his name be not brought forward, the convention presented it. He is therefore a Presidential possibility—a remote one, as the case stands, but yet not to be left out of the account. That he would be a fit nominee, nobody questions. In age, attainments, experience, habit of mind, and public service, he is Presidential timber. It is no secret that he would be first choice of many Cleveland men. The ex-President plainly intimated the other day that Gray would be his own preference. We understand that it was largely due to the insistence of friends of Cleveland that the Delaware Convention decided to instruct for Judge Gray. That insures putting him in nomination at St. Louis, and having him in reserve in case of a deadlock. But, of course, all this is highly contingent. Judge Gray is too seasoned in Democratic politics not to know the immense handicap of coming from a small State. He is also, we doubt not, fully aware of the strong drift of the South to Parker, as the candidate of the State with most electoral votes. Unless something now unforeseen occurs to check that, the probability of Judge Gray's figuring seriously in the balloting must be considered very slight.

Committeeman Payne has gone West, declaring that there is no use in trying to patch up Republican differences in Wisconsin. Neither faction has been willing to compromise on a half vote in the National Convention, and they are an incorrigible lot generally. Mr. Payne adds that the National Committee can scarcely be expected to go into the legal questions involved, since the whole matter has already been taken into the courts. Yet this hardly disposes of the difficulty. Somebody from Wisconsin will have to be seated in the National Convention, and the decision of the courts is not likely to be made until months after that convention has adjourned. There may be found a way of evading a square decision, with its unavoidable offence to one side or the other; but the attitude of the Wisconsin Republican press since the split shows how jealously the leaders are likely to resent the least partiality shown to their opponents by the authorities of the national party. It is one of the interesting possibilities of the situation that the convention may decide one way and the courts another. Should this happen, besides increasing the bitterness of factions already prepared for extreme measures, the campaign will reveal the relative influence on the every-day voter of a judicial decision based on strict law and precedent and a pronouncement by the party Supreme Court.

Mr. John A. Kasson has emerged from retirement long enough to express his views on the Iowa platform. He regrets that "meaningless platitudes" have been substituted for the plain talk on the tariff to which the farmers used to be treated. He tells the latter that not one politician in a thousand understands the conditions of our foreign trade. They do not know that if the market for our surplus products—wheat and corn, for instance—were lost to us, the effect on the home industries would be just as bad as if an equal amount of foreign goods were imported. It is a surplus on the home market, no matter what its cause, that makes prices sag. Foreign outlets are needed, but Mr. Kasson sees the absurdity of trying to create them by "reciprocity in non-competitive products only." There is not enough business of that kind in sight "to maintain a store at a Kentucky crossroads village." Plainly, Mr. Kasson is still feeling sore from the treatment he received at the hands of the Senate. Dingley, he says, knew nothing of "non-competitive" reciprocity. He offered the Canadians in the British-American Commission larger or smaller reductions, and in some cases even free trade. And President McKinley construed the reciprocity provision in the Dingley law in the same spirit: he sent Mr. Kasson abroad to negotiate treaties, and never thought of telling him that they must be of the "non-competitive" kind. But the Senate would have none of them. They were ingloriously pigeon-holed, and Mr. Kasson made the discovery that he was about the only person that had taken reciprocity as anything but a joke.

Gov. Yates of Illinois "believes that all those upon the payrolls should be as active in his behalf as were scores of others who had not benefited under the Administration." This is the reason, as stated in Chicago newspapers, for the summary removal of twenty-six State employees by the defeated candidate for renomination. The men removed, fifteen of whom were delegates to the late State Convention, are those who failed to support the final Yates-Deneen combination which gave the nomination for Governor to the young Chicago attorney, and was supposed to mean that Yates would get Senator Cullom's place three years hence. That the Governor has the latter in mind is indicated by the utterance of a Chicago State employee who has fallen under suspicion of disloyalty. "I had my eyes

opened," he said, "and propose to lead a different life. . . . I will show Gov. Yates that I am his friend and can be loyal to him. How? Why, by supporting him for United States Senator to succeed Shelby M. Cullom. Two years hence I shall be a candidate for the Legislature, and, if elected, the Governor will get my vote for Senator." Yates will hold office until the end of the year, and it will be instructive to watch his tinkering of that machine which, while not strong enough to keep him in the Governor's chair, is depended upon to carry him to the Senate.

Last week's *Outlook* printed the appeal which the Philippine Independence Commission addresses to both political parties, urging that a promise of independence be made to the Filipinos by both national conventions. It is a document drawn with moderation yet force, and is signed by weighty names. Its position is sustained, moreover, by hundreds of leaders in the college world, as well as by eminent clergymen, by business men, judges, philanthropists. It is safe to say that a petition so influentially endorsed was never presented to a political party in this country. It is a select body of learning, piety, and sound and patriotic judgment, appealing to political managers. Will the Republicans hear or forbear? The *Outlook* advises them to turn their backs on the intelligence of the nation. Its arguments are that national independence is not necessarily desirable, and that the Filipinos do not really want it, though they say they do. It seems that the misguided creatures have not grasped the great truth that "the will of a community is something more than the individual wills of *all its members*." Hence they failed to perceive that the way to find out what they desire is, not to take a vote, but to ask an editor in New York.

Secretary Taft's remarks to the Philippine commissioners on Friday show just where the President stands as regards Filipino independence. Mr. Roosevelt has for nearly three years been traversing two hemispheres in tight shoes, which, however, he expects to discard after next November. His heart has always been in the right place, and he has only been waiting "to be absolved by the expiration of his present term from the obligations with regard to the policy of the late President, in order to bring about at least the partial independence of the Filipinos." This assertion ought to do away with any suspicion that might otherwise arise regarding the tone now being adopted by the Administration towards our subjects in the Far East. The most cynical cannot say now that its eyes have been opened by the Philippine Independence Committee's petition, with its rapidly increasing signatures. Pressure of no sort was required to make Secretary Taft hint to the Philippine commissioners that if President Roosevelt is elected this fall, the islanders may soon enjoy home rule. In view of this announcement, Secretary Taft will probably no longer regret to have independence openly talked about in the islands.

Roosevelt is not, in the opinion of Mr. James Bryce, the greatest President since Washington. In the telegraphed account of the dinner to Seth Low in London, June 2, Mr. Bryce, who proposed the toast, "The President," was reported as guilty of the extravagant compliment of setting Mr. Roosevelt next to the Father of his Country. But none of the London papers which we have received so report the utterance. There are two printed versions, essentially the same: "One of the most striking personalities who had ever sat in the chair of George Washington," and "one of the most striking and brilliant personages who ever sat in the chair of George Washington." Now, in using the word "striking," Mr. Bryce shows that "discriminating knowledge" for which he is distinguished, since no adjective could more fitly describe Mr. Roosevelt. Striking he is, and always has been. He strikes when the iron is hot; he sometimes strikes before it gets hot; and he keeps on striking after it has grown cold.

"Brutal wrong-doing or an impotence which results in a general loosening of the ties of civilized society may finally require intervention"—when President Roosevelt wrote these words some three weeks ago, he had his eye, not on Colorado, but on the countries of Central and South America, over whose manners and morals he has constituted himself censor. Yet when the naughty revolutionists in San Domingo, Panama, Colombia, and Guatemala read the dispatches from the Cripple Creek district, in our own highly civilized and profoundly peaceful America, they will probably sit up and rub their eyes in amazement. "Why," they will ask, "is President Roosevelt so much wrought up over our teapot insurrections? Why will he not allow us to indulge in our national sport? He is not fulminating against the Colorado rebels, not sending Federal troops to quell them." The trouble with these simple-minded Spanish-Americans is that they do not understand the beauties of our Constitution. The President has no right to interfere in the affairs of Colorado unless the Governor appeals to him for aid, or unless the functions of the central Government, such as carrying the mails or enforcing the decrees of the Federal courts, are interrupted. The Governor of Colorado has emphatically declared that he needs no help. For President Roosevelt, then, there is nothing to do but watch the struggle with sympathetic interest. Nor can he reply to the appeal of the Colorado miners, who have vaguely in mind the precedent of the President's intervention in the Pennsylvania coal strike. But, in the first place, that was not strictly a local disorder. It threatened misery to the people of a score of States. Furthermore, the President professed no shadow of legal right to interfere. He merely volunteered his good offices. Nothing in the Colorado situation calls for even so much as that.

Yet "civil war" is the only term that fitly describes the struggle between the striking miners of Colorado and the State troops. The rebels were intrenched on Wednesday week in a cañon, but, after a sharp contest, they were finally dislodged by Gen. Bell's force, which killed one and took fourteen prisoners. The rebels held other intrenched positions on the surrounding hills, from which they continued their attack on the troops. The miners have taken arms against the constituted authorities for the sake of the God-given right to murder anybody who will not join their union and work according to its regulation. They have set the rules of their organizations above State law, above Federal law, above the Constitution and the Declaration of Independence. Men are not entitled to life, liberty, and the pursuit of happiness unless they conform to the hours and wage scale of the union—the basic principle upon which this republic now rests. The Atlantic Coast Seamen's Union is also contending for "recognition"—that is, the exclusive employment of union men. There are, of course, a few old fogies scattered about the country who still cling to the theories of our forefathers, but rifle, rope, and dynamite ought to make short work with them.

The quarrel between the Socialists and trade unionists of the Central Federated Union may be smoothed over, but at least it will have served to point an interesting distinction between these two industrial panaceas. Socialism is a cure-all; its advocates desire the elevation of an entire class, and the benevolent absorption of the bourgeois and the capitalist in an enlightened proletariat. Trade unionism, on the contrary, is limited; it seeks simply the welfare of those who belong to the union. In its spirit and methods it resembles the Trusts. Accordingly, a great gulf is fixed between the two movements. The last thing that unionism would consider is the abolition of such special privilages as Socialism condemns; Socialism, on gaining control of a State, would include in one proscription the labor syndicates and the commercial. No wonder, then, that

the Central Federated Union dislikes to give the Socialists a hearing. It should be noted, however, that this theoretical incompatibility might yield to practical considerations. Whenever Socialists become opportunists, they tend to draw in the labor organizers; in the same way, whenever unions belcome liberal enough to include all the workmen of a trade, they become excellent material for the Socialist propaganda. But this accord, which has been rather successfully reached in Germany, France, and Italy, seems still distant in the United States.

It is to be hoped that the removal of Col. Pratt from the superintendency of the school for Indian youth at Carlisle, Pa., means the establishment of a new order in that institution. What is needed just now, is not merely a change of temperament in the superintendent's office, but a change of sentiment among the pupils. The Indian in his native state is quite enough of an individualist without stimulating this trait in his education. Col. Pratt's theory has always been that it was the first business of each Indian boy to get to the top as soon as he could, and—as the boy almost inevitably interpreted it—by any means he could. Some saner friends of the red man thought that a race hardly emerging from savagery was not ripe for such inspiration. They felt that the first duty of the young Indian to whom a better path in life had been opened, was to try to help his brethren to walk in it with him. The missionary spirit—or "team work," if one wishes a more secular term—seemed to deserve more encouragement than the spirit of selfish enterprise, at the outset of a career in domestication. The Pratt ideal has always been the planting of each Indian by himself in the midst of our Eastern civilization, and the consequent elimination of the race by its absorption into the white social body; and his theory of educating the individual Indian for competition with his better-equipped Caucasian neighbors fitted into this scheme fairly well. But the scheme itself has, in general, proved a grievous disappointment. Only in isolated instances has an Indian found his place and held it in the East. The great mass of his fellows have realized that the crude conditions of a frontier country were better suited to their social needs for the present; and, when they have returned to their old home and their own people, an education which spurs them to compete rather than to help has often stood them in bad stead.

Lord Lansdowne was asked in Parliament on Monday concerning the coastwise regulations of other countries, with particular reference to our Philippine policy. The reply was that the proposed restriction in the latter case seemed inconsistent with the promise of this country at the time the Treaty of Paris was drawn up, and that the matter was now under discussion at Washington. Lord Lansdowne's point has been generally accepted in Europe in the past. The British Board of Trade reports have called attention to the fact that the treaty gave Spanish vessels the same rights in the Philippines as American until 1909, adding that "we have official assurances that British shipping will be treated not less favorably than Spanish." Of course, as Lord Lansdowne remembers, our new law will not take effect until 1906, but that is not the important point. The question is, have we been guilty of a breach of international morality? A full answer to the question asked in Parliament would reveal us in a pitiful light. It would show that of the eight principal countries with colonies, Great Britain, Germany, Holland, Denmark, Portugal, and practically France throw open the trade between the mother country and its possessions. The United States is less than the least in this particular. It is determined to play the dog in the manger. If it cannot supply its colonies with shipping on fair terms, it is determined that no other Power shall, promise or no promise.

All attempts to hush up the Congo State scandal are thwarted by Earl Percy's vigorous language before Parliament on Thursday. "Insensate inhuman cruelties," he charged, were committed by the Congo officials "in order that they might profit by the collection of rubber." These were serious words to use of a friendly Power, and it is not to be imagined that the Under Secretary of Foreign Affairs was speaking at random. The evidence laid before Parliament was chiefly that of the British consul to the Congo State, Roger Casement. This has been communicated to all the Powers—again a very grave step—and the United States, Italy, and Turkey have agreed to give the matter careful consideration. Eliminating the Turkish adhesion as an execrably bad joke, it seems probable that England may have to take up the affair single-handed. She has a great stake in the matter. Her possessions crowd the Congo State and suffer as it suffers. Furthermore, in case Belgium were ousted as a faithless trustee, England would figure largely among the residuary legatees. Humanity and self-interest, then, combine to urge England to force Belgium to cleanse its rotten administration. And the mass of evidence against the Congo State officials cannot be brushed aside by hinting that Great Britain is preparing to play the land-grabber again. Belgium has fallen almost by chance into a gigantic task for which she was singularly ill-fitted. It appears that, in the name of commerce, she has made a hell on the Congo. For that she is answerable morally to all the civilized Powers; diplomatically, chiefly to her neighbor, Great Britain. We in the United States should with ill grace interpose to save the negroes of the Congo from having their hands cut off, before we have stopped burning our own negroes at the stake.

It is a noteworthy coincidence that about the time the Sultan was hastening to approve an investigation of Belgian atrocities on the Congo, he received a note from the French Foreign Minister demanding that the Armenian massacres should cease. M. Delcassé reported on Thursday to the Chamber of Deputies: "I have informed the Porte that the time for repression is over, and that it must beware what responsibility it incurs. The French Government will not cease to do its whole duty." This protest to the Porte marks a new stage in French diplomacy in the Near East. M. Delcassé had before shown a keen interest in the Macedonian question, and generally persons of influence have felt that France, as the most disinterested party, should take the lead in forcing the Sultan to observe his European covenants. We have long maintained that only France and England are in a position to do this necessary work, and that the Concert of Europe would follow their initiative. On this matter the publicist M. de Pressensé recently wrote in *L'Humanité:* "I firmly believe more than ever that it would be sufficient for all those Powers who were parties to the Treaty of Berlin and who have not sold their consciences for concessions from the Porte, to adopt collective steps in Constantinople with the view of stopping bloodshed."

The Brazilian naval-reorganization measure has a strategic look. If it is not really a gentle hint to the Kaiser and the President that Brazil does not doubt her ability to protect her territory and develop her "civilization" in her own way, she will probably not be sorry to have them think so. Seriously, the bill which has just been brought forward in the national legislature is of a sort to make one question the motives of those behind it. The latest accessible list of the Brazilian navy enumerates seven ships, all but two under 5,000 tons, in addition to twelve torpedo boats of various descriptions. The new measure provides for twenty-eight war vessels. This conception of the needs of the nation is too magnificent to be convincing. Chili and Argentina have been selling their ships, but it is not likely that they will be in the least frightened by this new move on the part of Brazil. We fear that the real significance of the measure is in the statement that "the bill contains an expression of opinion that the vessels should be constructed in British yards."

THE NEW DEMOCRATIC ALIGNMENT.

In all the activity of the Democratic party prior to the St. Louis Convention, we may see something larger and more significant than the struggle over candidates or about the platform. The latter, indeed, is practically determined already—that is, in its strategic plank. Free silver will not have the cerements of the grave stripped off it. That means, at any rate, that the campaign will not be lost before it begins. This is an enormous gain for both party and country, whoever the nominee for the Presidency. And keen as still is the competition on the personal side, the broad movement within the party, rising above the fortunes of any individual candidate, is already clearly defined.

It may best be described, perhaps, in terms of geography. The alliance between the South and the West has been dissolved. Again there has been established the old alignment of the South with the East. This is the large political truth which really comprehends and explains the Parker candidacy. It is plainly no question of personal enthusiasm. Had the lamented Russell lived and the South been to-day rallying to that chivalrous Massachusetts Democrat, it might have been said that it was his gallant bearing and magnetic leadership that were bewitching the hearts of men. Nothing of the kind has been or can be asserted in the case of Judge Parker—he himself would be the first to disallow it. It is the accident of his position as the most available candidate of a great Eastern State which has brought him to the front; and that is only another way of saying that the South has turned from the setting to the rising sun—from a hazardous casting in of its lot with the radicals and the Populists of the West to a sober choice of steadier allies in the East.

It was after the party disasters of 1893 to 1895 that the South broke away from its historic relations with the Eastern Democracy, and struck hands with the aggressive Democrats of the West. There was something to say for that strategy. Populism threatened to overrun the South. Its ravages in Alabama and North Carolina were alarming. If the situation were to be saved at all in 1896, there was a superficial argument for overcoming the Populists by uniting with them and absorbing their doctrines. Such were Bryan's tactics. If the thing could be done in the West, why not try it on in the South and let the East go? Cleveland had carried Western States—Illinois and Wisconsin—in 1892; Bryanism made Colorado sure and Kansas fighting ground, with good hope of all the mining-camp States. It was a gambler's chance, but the South took it.

Of course, everything was lost. As might have been foreseen, the same causes which drove every Eastern State into the Republican party, turned Illinois and Wisconsin against the Democrats by majorities in the hundred thousand. Worse than that, more damaging than the mere loss of one election, the Populist taint remained to curse the party for years; to make its defeat in 1900 more calamitous than in 1896; to empty the Senate of Northern Democrats and to make a Democratic Governor north of Mason and Dixon's line a rarity. With nothing but such huge disaster behind and no hope in the future along the same lines, the Democratic leaders in the South awoke this year to the need of a change of policy. That has already been effected. The South lifted its eyes eastward. Asking nothing for itself, it waited only for an Eastern Democrat to come forward to supplant Bryan and avert Hearst. That is the true explanation of the Parker movement. He but symbolizes the union of the Democracy of the South with that of the East.

It is a situation full of hope for the party. In saying that, we do not mean to predict its immediate success. A candid survey of the field shows how great are the electoral difficulties which the Democrats have to overcome. The new apportionment is against them. Under it, the old combination of the South with New York, New Jersey, Connecticut, and Indiana is not of itself a winning one. At present the number of electoral votes necessary to an election is 239. The South will have 159. Add in the 39 of New York, New Jersey's 12, the 7 of Connecticut, and the 15 of Indiana, and you are still 7 electoral votes short. Where are they to be picked up? In Colorado? She has but 5, and is apparently preparing to give them to the Republicans. Other possibilities exist, but we will not pursue the matter. It is evident to any fair mind that, lacking a tidal wave, of which there is no present sign, the Democrats have an exceedingly arduous battle before them. To triumph, they will have to hold their lines everywhere intact, while driving back their antagonists in unexpected places. This being the hard fact, it would be foolish to speak of the new Democratic alignment as a presage of victory. But it at least makes a future victory possible, and of a sort which would not spell calamity to the country. It points the way to the formation of an Opposition party which is not disabled from performing its needed function by affrighting people on sight. It foretokens the affirmation of wholesome political truths, and the denunciation of dangerous tendencies in the party in power, in a way which will recall

> "——old forgotten principles,
> And through the nation spread a novel heat
> Of virtuous feeling."

Success thus merited may in the end be attained.

STATE COMMITTEES.

In the political activities of this year a factor of unusual prominence has been the influence of the Central Committees in some of the important States. Here in New York we see the Governor assuming the position of State Chairman, thus uniting in his own person the party functions of working out policies and conducting campaigns. In Indiana, the defeat of the Hearst forces was to be attributed partly to the action of the Committee in excluding delegates from the temporary roll of the convention; while in Wisconsin the right of the Central Committee to go behind the face of credentials in deciding what delegates should be admitted to the convention hall, has been made the basis of an actual revolt. Looking at any one State, the power and importance of the State Committee will be found to have varied greatly in different years; but, taking the country over, there appears to be a tendency toward giving the State Committees larger control, aside from those matters of purely executive character which have always been in their charge.

The State Central Committee was created because it was necessary to have some one to look after the details of campaigning, secure speakers, call meetings, distribute campaign literature, bring out the full vote on election day, and see that the party had its rights at the polls. Platforms and candidates were attended to by the convention. The theory was that these two functions were entirely independent. The convention dealt the cards. The committee's duty was to play the hand, good or bad, with all the sagacity and skill it could summon. It was usually in real sympathy with the party issues, because the leaders responsible for the candidate and the platform would naturally control the committee as well. Otherwise, the bond was much like that between agent and principal, the committee making the best of a situation not of its own making.

For the extension of its power since that time, two things are chiefly responsible: the need for lodging the authority of the party somewhere during the months between conventions, and the adoption of the Australian ballot. The direct primary, should it be generally adopted, will tend in the same direction. In most States the party conventions and committees have already been changed from mere conveniences established by party rule to organic parts of the electoral system, governed no less than the polling booth itself by the State law. In a study of the State Central Committee as it exists to-day, contributed to the current number of the *Political Science Quarterly* by C. E. Merriam, the stages in the legal recognition of the committee are traced. The convention must always, as a matter of course, be made sponsor for the nominations to be placed under the party emblem, but va-

cancies often occur between the adjournment of the convention and election day. The laws of nearly all the States authorize the Central Committee to fill such vacancies, sometimes with the proviso that, if time permits, a special convention shall be called, but in others without that limitation. Hence arise such significant provisions as in Colorado, where the Democratic committee has full power "to consider, pass upon, and determine all controversies concerning the regularity of the organization of the party within and for any Congressional district or county or city in the State of Colorado"; or in Pennsylvania, where the Democratic committee may "direct such changes as may appear necessary" in the rules of local organizations and enforce its demands by refusing representation until they are complied with. In a Missouri case involving such powers the court decided, "It would seem inherently necessary in all party organizations that there should be some governing head, some controlling power, some common arbiter, which, if emergency should arise therefor, can lay its hands on the heads of the warring factions within the party and compel the observance of wholesome regulations, conducive alike to efficient party organization and to good government."

The examples we have had this year do not, to be sure, show the State Committee as a very successful pacificator, but it has gained its end where it has used its full powers. In Wisconsin, for instance, the Committee exercised the right of going behind the prima-facie credentials of delegates in making up the temporary roll of the convention. Whether this would have changed the complexion of the convention, and whether it was contrary to precedent, are disputed points, but such a right becomes momentous whenever the balance of power is held by the delegates whose seats are contested. The alternative in Wisconsin, as in all other States, is to let the county or district chairman's certificate admit to the temporary organization of the convention. Under either practice, the convention can overrule the decision so far as the make-up of the permanent organization is concerned, though it is apt to be too far faction-bound to use its calm judgment.

If power is to be added to that portion of the party organization which never dies, and if it is to become in fact the repository of policies and authority through fifty-one weeks of every year, it should be recognized as such. If its function is to be solely "practical politics," it may be all very well to pick out its members for their shrewdness in pulling wires and rounding up delegates. If, however, it becomes the living, active force within the party, the same high qualifications should be sought in the State Committeemen as in the candidates themselves.

IMMIGRANTS AND STEAMSHIP WARS.

Further cuts in steerage rates went into effect on Monday. Immigrants can now obtain passage from several English and Scottish ports to New York for $10, where formerly they paid $25. This is the latest move in a rate war between rival steamship companies. In consequence, however, much fear is expressed that the result may be to induce a large influx of highly undesirable aliens. The slums of Whitechapel, it is said, are prepared to discharge upon us a loathsome mass of poverty, filth, and disease, which, under the comparatively lax immigration laws of Great Britain, has for years poured in from Russia, Austria-Hungary, and the Balkan States. According to Frank P. Sargent, Commissioner-General of Immigration, this noxious invasion has already begun.

We are inclined to think that the situation, actual and prospective, is greatly exaggerated. The immigration laws provide an adequate protection against the dreaded inundation. Only a year ago these laws were reënacted, added to, and in numerous ways made adaptable to present conditions. Under the new statute, practically all the objectionable aliens said to be tempted by the reduced steerage rates may be excluded, and the responsibilities of the steamship companies increased. It groups objectionable immigrants under three heads—the physically and mentally deficient, the hopelessly poor, and the morally depraved. It thus excludes all idiots, epileptics, and insane persons; all persons who have been insane for five years or who have had two attacks of insanity at any time. It likewise prohibits the landing of all aliens suffering from loathsome or contagious diseases. Under the second head come professional beggars, absolute paupers, and all who are likely to become public charges. Polygamists, anarchists — of philosophical or bomb-throwing variety —prostitutes, procurers, and persons who have been convicted of crimes involving "moral turpitude," are in the third class. In addition, there is the contract laborer, with the much-enduring Chinaman. The law of 1903 also requires increased vigilance by steamship companies. They are forbidden to advertise, except in the most perfunctory way; and are made subject to a fine of $1,000 for every illegal immigrant they attempt to land. They are required to make out complete manifests of all passengers, and answer a multitude of questions concerning their physical, mental, and financial status. They must themselves deport all rejected immigrants, paying the expense of their maintenance while here. And the period during which they may be called upon to return landed immigrants who become paupers is increased from one to two years.

Though the new law has been in force little more than a year, it is said to be working well. In August last the Government sent Mr. Marcus Braun to southeastern Europe to investigate its workings. His official report contains much that is pertinent to the present situation. He found that the steamship companies, especially those engaged in the present rate war, were doing everything in their power to improve the quality of immigrants. They had curbed the enthusiasm of their agents, in some cases refusing commissions to those who improperly solicited business; and had taken every precaution to fortify themselves against diseased passengers. In the main, Mr. Braun commends the English and German steamship lines for their rigid medical inspections. He also reports the coöperation of foreign Governments, especially Austria-Hungary and Italy. The mails are closed to alluring literature describing the American Eldorado. Mr. Braun says that letters of this kind are confiscated by hundreds of thousands, so that the old abuse is practically ended. He found nothing to substantiate the popular notion that the Italian Government encouraged the emigration of undesirable subjects. On the contrary, it does everything to keep this very element away from America. The Government, declares Mr. Braun, is in constant fear that the United States may pass laws against Italian immigration, which would be a serious thing for Italy, as whole towns in the southern part are supported mainly by remittances from America. The Italian authorities, Mr. Braun found, had imprisoned several of the most notorious steamship "runners." All over Europe it is generally understood that it is no easy thing to get into the United States. Thus, thousands of Russian Jews are sent to London, where they spend a probationary period of about six months, in the hope of putting themselves in sufficiently fit physical condition to gain admittance. For the same reason, thousands of the proscribed classes land at Canadian and Mexican ports, with the hope of eventually slipping in over the border—unquestionably a real danger. The only immigration law generally despised and evaded is that against contract labor.

Thus there would seem to be no impending peril from present steamship rivalry. Like all wars, it is expensive. According to general belief, the companies lose money by every immigrant; and it is not likely that they will care to increase the expense by numerous $1,000 fines. If they go to reckless extremes, our remedy is to enforce the laws. Such aspiring citizens as are undesirable we can keep out; such as are desirable we are, of course, only too glad to let in. According to the latest immigration reports, a growing percentage of immigrants is excluded under the act of 1903.

Last year we sent back 8,769 at the steamship companies' expense, against 4,974 in the previous year. The larger number of the diseased were Japanese, who, of course, are not affected by the new steamship rates. Evidently, however, our local officials have learned how to apply the new law; and it is to be presumed they will not hesitate, in the next few weeks, to make such use of it as occasion requires.

REVISING THE CANADIAN TARIFF.

Minister Fielding, in his budget speech, has presented a plan for revising the Canadian tariff, and naturally he has not failed to commend the schedules he arranged six years ago by pointing to the sensational prosperity that Canada has enjoyed ever since. How far Mr. Fielding's tariff created the forests and fisheries of the Dominion, how much it did to make the Northwestern Territory fertile, we may decide later. For the moment it is enough to show that Canada has greatly prospered under schedules so low that, we are assured, their adoption would ruin this far richer country. If industrial development and agricultural returns are possible only under the ægis of a virtually prohibitive tariff, then Canada should long ago have gone to the international poorhouse.

The Fielding tariff of 1898 was a timid protective compromise on the part of a free-trade party. The Liberals found themselves very much in the position of our Democrats in 1892, bound to revise a high tariff, but without the courage to reduce it frankly to a revenue basis. So Mr. Fielding's bill produced schedules which practically have been good revenue-getters, but have remained essentially protective. Under the grudging protection, however, which the industries of Canada thus received, our infant industries would have been stricken with terror of death. Food and animals, for example, enjoy only 26.47 per cent. protection, against our 68.11 per cent.; manufactured articles, 24.24, against 49.11. In general, Canada's tariff wall is about half as high as ours, and yet Mr. Fielding holds that in many places it is higher than need be. Apparently, the infant industries of Canada are far more robust than ours.

As for Mr. Fielding's plan of revision, its most significant feature is the fixing of three schedules—a maximum, a medium for most favored nations, a minimum for the British Empire. This virtually confirms the present practice of the Dominion, under which German goods pay a sur-tax, United States goods the average schedules, British products 33 1-3 per cent. less than the average rates. Any advantage to Great Britain, however, is largely offset by raising from 23 1-3 to 30 per cent. the minimum duty on woollens, of which Canada imports about $11,000,000 annually. Small concessions to Great Britain are reductions in the duties on china and pottery, and on window and plate glass, the latter sweeping. These reductions are quite as likely to favor the United States as England. Molasses from British countries giving a preference will be admitted free. Refined coal oil will pay only 2½ cents a gallon instead of 5; crude oil will be free, but the Canadian refiner will receive a bounty of 1½ cents a gallon on crude oil manufactured in Canada. This is an artificial attempt to bolster up an industry apparently dwindling through natural causes. Much of this bounty may go, in the long run, into the coffers of the Standard Oil Company.

Mr. Fielding's proposal to prevent "dumping" has excited some comment, but his plan comes very near to our own practice of marking up invoices and penalizing undervaluation. Mr. Fielding would simply charge a stiff percentage of the difference between the invoice and the fair market value of the goods at the place of shipment. Evidently that would make it very expensive for any Canadian importer to encourage the foreign "dumper," though in practice it would be rather difficult to apply so drastic a penalty. "Dumped" goods do not bear their horrid character on their face like a mark of Cain, and practically it might be hard to determine just where a reasonable concession from the foreign market price ends and dumping begins.

Far more edifying than these dry details is the spectacle of a growing country calmly discussing schedules which we are told would spell ruin here, and undertaking substantial revision of its tariff downward without the slightest fear of shattering the industrial fabric. Why should that scaling process which is held in fairly superstitious horror at Washington be cheerfully proposed at Ottawa? Why, simply because Canada has never been keyed up to our artificial pitch. Her manufacturers have never grown so fat on treasury favors as to hold the rod over the entire country. The result is that the Dominion has never got into that ridiculous *impasse* in which our ruling party lies paralyzed. Canada has never built up a customs system so sensitive that if touched anywhere it will turn out a veritable infernal machine and blow up the meddler, with all hands. There is still a saving remnant in Canadian politics which sees that the tariff has played a very small part in the growth of the country. The fertile vacant places of Canada have been her wealth; her forests and teeming waters. She thrives precisely as we have done, by hard work applied to the gifts of nature. Yet that wholesome truth is now questioned there. Her manufacturers, like ours, insist that the Government owes them a living, and a good one. Still, she has kept her freedom of action, and Mr. Fielding's proposals, though obviously imperfect, show at least an intention to legislate for the nation, and not for a class.

To us who are told that our prosperity and our very safety lie in letting the Dingley bill alone, Mr. Fielding's act must seem, according to our political affiliations, like that of a hero or a madman. That he seems neither in Canada indicates either that our northern neighbors are running wantonly into self-destruction, or that we are living under the tyranny of a most insubstantial bogey.

SCIENTIFIC AND OTHER DEGREES.

Science reports in full a discussion by the American Society of Naturalists on the subject of academic degrees conferred for scientific work. Should the B.S., M.S., and D.Sc. be retained, or should the bachelor's and master's degree in arts and the doctorate in philosophy crown work in the sciences as well as in the humanities? To-day the former degrees do not stand for attainments distinctly in the sciences. But in consequence of a growing feeling that scientific studies, though not essentially superior, are still as dignified as the classics and immediately more useful, the latter have so largely fallen into abeyance that the degree of bachelor of arts has come to represent all but no classical knowledge at all. The naturalists and several college presidents who participated in the discussion practically agreed that the collegiate B.S. (President Jordan explained, "bachelor of surfaces") is rapidly losing its reason for existing, and that the sooner it is abolished the better. Most of the younger institutions—Johns Hopkins, Leland Stanford, and others—have never adopted it at all, and have never felt the want of it. As for Chicago, which gives baccalaureate degrees in arts, science, and philosophy, and whose students of commerce become bachelors of philosophy, we will hope, with Professor Cattell, "that idealism will be radiated from the packing houses of the city." The suggestion was made that the science degree might be awarded for purely technological work in schools of engineering. But this is another matter.

Incidentally, the naturalists spoke of the honorary degree and of degrees in general. The "Who's LL.D.'s" have of late years multiplied with the rapidity of micro-organisms, and the number at present must be nearly as great as when "it repented the Lord that he had made man on the earth." Thirty-nine were created at Wisconsin's semi-centennial last week, including Jane Addams of Hull House. The indiscriminate bestowal of the honorary degree upon successful men of commerce and politics is obviously tantamount to the formal endorsement of their civic ethics by the academic staff of the country, and to their being held up for emulation be-

fore graduating classes and the community in general. It thus mischievously adds to the babel-confusion of ideals which alone makes it possible that so much anarchy, so much mendacity, so much folly and selfishness can live and prosper among us. Genuine merit is, and always has been, anxious for sympathy and recognition on the part of the best—often the more so, the truer and greater it is. But to-day it can hardly feel honored by a "vir probissimus" credential from the authorities, and it must surely feel offended at the knowledge that it is sharing the honor with successful *arrivisme*, if not worse. Going much higher in the human scale, and coming to that which is more than merit, honorary college degrees seem actually ridiculous. "Herbert Spencer, LL.D.," would have been a forlorn joke in the Synthetic Philosophy. No wonder that one of the naturalists suggested that eminent investigators refuse the honor altogether.

As to degrees in general, there was a pretty unanimous feeling that they are a necessary evil. That they are universally demanded, every one knows. Long strings of degrees appended to the faculty names in a college catalogue beautify appearances, for anxious parents, much more effectively than would long lists of original contributions to human thought; consequently, no college catalogue can afford to be without them. In Germany a degree is an admission ticket to the table of the well-to-do middle class. In France it is supposed to have a handsome dowry-value. Consequently, the idea of abolishing the conferring of degrees in general should be discarded as sheer madness, destroying, as it surely would, the numerical greatness of our colleges, and entailing material losses upon a certain fraction of the world's intellectual aristocracy.

Nor can we forget the marvellous modern development of the methods by which degrees may be acquired. There was a time when the *doctores rite promoti* were not *promoti* until after many years of residence in universities. We believe some fifteen years, at least, were deemed necessary for the attainment of a certain mental maturity certified to by the degree. But in these days of predigested, brain-creating cereal foods such enormous waste of energy is no longer necessary. All one has to do is to order by mail, from one of our correspondence universities, a lot of typewritten mental discipline; in grateful recognition whereof said university will promptly and cheerfully grant any degree desired—bachelor's, master's, doctor's, according to the quantity purchased—all on beautifully hand-made diplomas of artificial parchment paper. Even in most residence-colleges very little effort (and that largely muscular) is required for taking a degree. And it carries the valuable persuasion, especially to the holder himself, that he is sufficiently "cultured" for the higher activities of life. We confess we do not see the evil of it all. To our mind the modern degree is an ingenious time- and labor-saving device. Far from being ashamed of it, we are proud of it, as we are proud of many other wonderful institutions in our highly developed civilization. Thus we fail to comprehend how President Jordan can say that "academic degrees belong to the babyhood of culture," why President Butler calls them "the tinsel of education," or why Professor Cattell would "like to see academic degrees abolished altogether, or, as a second choice, to see the B.A. degree interpreted as meaning either bachelor of arts or bachelor of athletics, as the case may be, and then conferred on each college student when he attains his twenty-first birthday."

ITALY, FRANCE, AND THE VATICAN.

FLORENCE, May 28, 1904.

The hopes of the ultra-Socialists, Republicans, and Radicals that the Pope's "protest" against the visit of the Republican President Loubet to the King of Italy in the "Apostolic palace of the Quirinal in Rome" would frustrate the efforts of the Italian Government and the Pope to come to some amicable understanding (without, of course, any formal proclamation), are dashed to the ground by the fact that to-morrow the King of Italy visiting Bologna for the Exposition will be welcomed at the town hall by Cardinal Svampa, the Archbishop of Bologna, by the express order of Pio X. Both Victor Emanuel II. and King Humbert visited Bologna, the former when he went in 1860 to meet his new subjects who had thrown off the Papal yoke and proclaimed their unanimous will to form part of the constitutional kingdom of Piedmont. Then, of course, the clergy took no part. King Humbert visited the city three times—the first time just after he had ascended the throne, when Benedetto Cairoli was prime minister with Zanardelli; and on that occasion the Republicans opposed the participation of their party, but Aurelio Saffi and Giosuè Carducci not only participated, but the then democratic poet, who only a month before had refused the decoration of the Order of Savoy, was presented to the sovereigns and wrote his famous ode to Queen Margeret. The clergy was not represented, though the municipality then was composed of Moderates and Clericals. In 1888 Mgr. Battaglini, Archbishop of Bologna, wished to take part in the ceremony, but was forbidden to do so, and was reproved by Leo XIII. for his personal reception of Queen Margeret, when she went to the Church of San Petronio.

Your readers will remember the affront meditated by the Archbishop of Palermo in 1896, when the sovereigns on their visit to the great Exposition were prepared to visit the cathedral, as all sovereigns had done before them—as Garibaldi also did—and were received by the Archbishop. The orders of the intransigent Cardinal Celesia were that they should not be received, and Nicotera, informed of the meditated affront, frustrated it by conducting the sovereigns straight to the royal palace. The Cardinal Archbishop justified his prohibition by "the order of the Pope," who never abated his hostilities to the son of the usurper who affirmed "Rome intangible." His conduct after the murder of King Humbert was unchristian as it was inhuman. All funereal ceremonies were forbidden as far as it lay in his power to prevent them. Even the English Catholics were forbidden to hold or take part in them. The prayer of the widowed Queen was prohibited. When funeral rites were solemnly celebrated at Bologna, the Archbishop Cardinal Svampa was ordered to quit the city, which he, a fierce *intransigente*, did with ostentation. How is it that to-day he is to unite with the civil authorities in welcoming the King to the city which formed part of the temporal territory over which the sovereign pontiffs maintain their right to reign?

Altri tempi, altri costumi. The present Pope, who protects the Rosminians so maltreated and persecuted by Pio Nono and Leo XIII., recommending the study of Rosmini's doctrines to the youth of Italy in a recent brief, though the Rosminians are the only order who hoist the national flag during national festivals, takes every occasion to favor the association of religious authorities with national life. When the King promised, a month since, to visit Bologna, the Archbishop sent to Rome to know how he was to conduct himself on the occasion. The Pope answered by ordering him to take an official part in the reception, stipulating only that he should be the first authority received by the King, the precedence being due to his rank. The intermediary, Avv. Ambrosini, went at once to the Quirinal to inform Count Giannotti, master of ceremonies, of his interview; and that the conditions were accepted is proved by the terms of the prefect's invitation to the Cardinal, who replied on the same day (April 25): "I am much obliged to his Excellency for the happy (*fausta*) information which he has kindly communicated. Next Saturday I shall make it my duty to come to the town hall to offer the homage of my devoted reverence (*l'omaggio del mio devoto ossequio*) to his Majesty, the King." It was hoped by the *intransigenti* of all parties that, after the visit, the "protest" and the consequent agitation, the Cardinal would be advised to take a compulsory leave of absence, owing to a *fausto* illness. But the Pope did not see things in that light, and nothing in the conduct of the Italian Government during the month of May gave him the slightest pretext for altering his instructions.

Previous to the visit of the French President the prime minister, though on excellent terms with the Republicans and "reforming" Socialists, prohibited a Republican demonstration because offensive to the spiritual head of the Catholic Church; affirming that in the welcome given to Loubet on his "return visit" to the King of Italy there was no intention of gratuitously offending the spiritual authority of the Pope. For the same reason the address of the Freemasons was revised. Again, during the discussion of the budget of the Ministry of Justice, Ronchetti, an ultra-Liberal, under-Home Secretary during Zanardelli's ministry, in answer to some violent appeals for the introduction of a radical ecclesiastical policy, warned his "friends" that such a serious question must be made

the subject of a separate and grave discussion; that the special conditions of Italy in her relations to the Vatican were so intricate and serious that, while it was necessary to maintain the rights and dignity of the state (in which duty the Government never had been and never would be found wanting), this did not extend to provocation, to the creation of useless difficulties and vexatious conflicts—adding: "The reordering of ecclesiastical property is a formidable problem barbed with the most serious difficulties, to solve which all efforts have hitherto proved vain. Not less arduous is the reorganization of dioceses and parishes, which, indeed, never can be accomplished without the collaboration of the ecclesiastical authorities."

Anent the influx of the members of the Congregationists expelled from France, the minister stated the facts clearly, though it is well known that he is seriously perturbed by the increasing numbers of "native confraternities" which, by the pious fraud of purchasing lands and edifices in the name of a single person, are gradually reviving the old state of things supposed to have been abolished by the laws following that of 1867. He referred to the declaration of the Minister of the Interior, and explained that the law does not prohibit citizens from associating for religious worship, nor from wearing a special costume; and that the same law applies to foreigners. But it refuses to recognize the juridical personality of these congregations, and can compel them to a strict observance of all the laws of the state. He did not, however, deny the possible necessity of a new law for the hindrance of pious frauds; and, indeed, facts and figures show that, little by little, the religious corporations abolished in Italy are gradually reforming in increasing strength and numbers. Deputy Alessio has proved that the number of persons living in religious communities has increased enormously, that of women doubled. Many of them have returned to their old convents and monasteries under other names, and thence dispense alms and soup as of old. The old hostilities between Dominicans and Franciscans, between Jesuits and Somaschians, have disappeared.

But why on earth, it may be asked, if the intentions of both the Italian Government and the Pope are so amicable, was the "protest" launched when the visit was ended and everybody was rejoicing in the "All's well that ends well?" Because at the Vatican more than elsewhere "there are wheels within wheels;" because no Pope, angel and saint combined in one, can resist the pressure of the combined hostility of intransigent ecclesiastics and of tradition. On the 4th of May a brief note in the *Osservatore Romano*, the official organ of the Vatican, stated that a protest *had been* issued to the heads of all Catholic Powers; but no importance was attached to the news until, on the 14th, the text of the note, published by Jaurès in his Socialist paper, *L'Humanité*, appeared in the Roman papers with a comment by Jaurès showing that the protests sent to other Catholic Powers and that sent to France differed in an essential point, to wit: in the former the Pope explained "that only serious reasons of order and urgent motives of actuality had prevented the recall of the Papal nuncio from Paris." Compared with the anathemas of the two preceding popes this seems astonishingly mild. France is told that, owing to the singular benevolence of the Supreme Pontiffs for her, and to the signal benefits conferred on her, it behoved France above all other nations to act with the utmost delicacy towards the Holy See, and that the visit paid by the chief of that nation to "Him who, contrary to every right, impedes his civil sovereignty in Rome" (*Colui che, contre tutti i diritti, detiene la sua civile sovranità in Roma*) is a far more heinous offence than it would have been on the part of any other of the Catholic Powers, who have all abstained from so offending, although serious interests on the part of some (Austria), and ties of kindred on the part of others, held out strong inducements to them to visit the kings of Italy in Rome. The *Colui* is the only reference to the King of Italy in the protest; later it is said "that the visit was desired by the Italian Government in order to weaken the recognition of the rights of the Holy See." Giolitti and his colleagues were accused of cowardice, of truckling to the Vatican for not taking action on this. When presently it was known that Nisard, the French ambassador to the Vatican, had been recalled—whether for a temporary holiday or for good, it was not clear—the tempest augmented in violence. "Ministers of monarchy" were bidden to learn from republican France how to uphold the dignity of the nation, the rights of the State; were warned that they would soon be humiliated still further by seeing the papal nuncio packed off from Paris, by the total rupture of diplomatic relations between France and the Vatican, the abolition of the Concordat, the total separation of Church and State. Never since the dark days that followed Mentana has a discussion in the French Chambers been awaited as anxiously as that of to-day.

May 29.

The *Giornale d'Italia* has received the entire discussion by telephone. Delcassé's allusions to "the Papacy's absurd pretensions to temporal power," and Combes's decisive declaration that "France accepts no intervention by the Vatican in her foreign policy, that she means to put an end to the vain pretence, void of all value, of the Papacy to the temporal power," have sent through Italy a thrill of joy that for the moment effaces all other feelings. The telegram of the radical congress in Rome to Combes expresses the sentiments of all Italians who love and are proud of the patient fortitude, as well as of the heroic martyrdom, of the makers and keepers of Italy one and independent. J. W. M.

BARON HUEBNER'S DIARY.—II.

PARIS, June 1, 1904.

The Emperor Napoleon III. informed the diplomatic body of his intended marriage with Mlle. de Montijo on the 22d of January, 1853. It was a love match, he said; and was he not himself a *parvenu?* He alluded to the reserved attitude which the great Powers had maintained before recognizing the new French Empire, and to the fact that Austria had asked for the marriage of the Archduchess Marie Louise with Napoleon I. "This," wrote Hübner, "disquiets the public"; and to Minister Buol:

"The Ambassadors are not as alarmed as they were. . . . They feared for a moment that the Emperor would fly off their hands and throw himself into the world of adventure. A man who, at the age of forty-five, himself decides, to satisfy a caprice, to make a love match (especially if that man be an Emperor and change his flame into an Empress) at the risk of forfeiting the opinion of the country and of Europe—such a man, it must be confessed, is made to inspire apprehension."

The civil marriage took place at the Tuileries, and the next day the religious marriage was celebrated in the cathedral of Notre Dame. The public remained very cold; there were no acclamations, the spectators were indifferent and impassive. "You would have thought they were at the play, not understanding it, and thinking that it was not worth while to ask what it meant."

Hübner was not deceived by the apparent coolness of the Emperor when he spoke of foreign affairs:

"I am not reassured," he wrote to Buol, "concerning the Emperor's disposition. . . . Foreign politics will now become the ground on which he will by preference exercise his inclination for conspiracies, and I believe he will create difficulties for us in Italy, by helping secretly in Sardinia and perhaps throughout the Peninsula the demagogic party. But sufficient unto the day is the evil thereof."

In another letter he shows well his early comprehension of the Emperor's character:

"His policy at home, as well as abroad, has always been to talk revolution to the revolutionists and authority to the men of order. But there comes a moment when ambiguity of language is no longer sufficient. . . . At present he hesitates. It is for the cabinets to decide if he ought to be accepted. . . . Believe me, he will always be more yielding on great questions than on what, in the manner of Louis Philippe, he calls the humiliations. . . . The refusal of a mere courtesy revolts him. He sends forth fire and flame, and threatens a rupture with the Continent. If we wish to win him over in some measure, let us try to humor this susceptibility as much as our dignity allows. . . . Do not take me for a coward, my dear Count; do not believe, either, that it amuses me to play the courtier in this new court. It is far from amusing. But France is France; if we throw him into a bad way, he will set fire to the four corners of Europe, and we shall have much difficulty in extinguishing it."

Napoleon found the first occasion of playing a part in the affairs of Europe in the difficulties of the Eastern question. The mission of Prince Menshikoff to Constantinople brought matters to a crisis; the French fleet was sent into Grecian waters. The affair of the Holy Land occasioned endless discussions between the great Powers and the Porte. Hübner felt that a conflict in the East would be a terrible affair. There was not much harmony between the great Powers: Lord Palmerston was anxious to go to war against Russia and to draw Louis Napoleon into common action; Austria was wavering, for, though hostile to Russia, she had no desire to act with France. The marriage of the Duke de Brabant to an Austrian archduchess was considered by Napoleon an attack on himself.

"He thinks himself betrayed, threatened, humiliated; he makes on me the effect of a man out of his mind. I do not think that his anger is simulated. We must put ourselves in his place. He owes the throne of France to a *coup de main*, made by a few battalions. He wants to keep it, but sometimes feels it trembling under his feet. Then he becomes alarmed and angry. In those moments I think him capable of anything."

Lord Palmerston was in favor of vigorous action against Russia, but Lord Aberdeen and King Leopold (who was always a prudent adviser of Queen Victoria) wished to avoid war. The marriage of the Belgian royal prince with an Austrian princess made Napoleon furious. While matters were hanging on a thread, Hübner wrote: "I pray God that they at Saint Petersburg be wise. If the Emperor Nicholas makes war on Turkey, France will follow England, and what will England do? The whole question is there; and what would be our situation?" Austria had signed the treaty of 1841 which maintained the independence and integrity of the Ottoman Empire. Did Russia's demands threaten this independence? The Sultan said that they did; France and England said the same. Austria and Prussia stood reserved, but Hübner confesses that in Germany public opinion was decidedly hostile to Russia, and the Anglo-French alliance was forming. This alliance was, in Hübner's words, the "danger of the situation."

We must note, here and there, the portraits traced by Hübner. After a visit to the Malmaison, where lived at the time Queen Christina of Spain, he writes:

"The classical features of her head and her face, which would still be handsome if it were not for the sensual lips, would make one forget the exuberance of her Catholic Majesty's figure. Add to this eyes which sometimes shoot fire, sometimes so dreamy as to cover themselves with a transparent veil, and you will understand what the old General Infante, one of her innumerable ministers, once said to me: 'At the Council table, she asks for impossible things. You refuse. She insists. You are still inexorable. Then she breaks your opposition with a look, a single look, and you leave the Council with shame on your face and death in your soul.' It was in this way that she wore out all her ministers and ended by being turned out of the country."

Persigny often had familiar conversation with Hübner. "'The Emperor Napoleon,'" he once said, "'has on his side the people; Austria has the educated classes. Give us the educated classes and we will give you the people.' These words, more paradoxical than witty or true, betray the inner sufferings of the Tuileries; the Tuileries feel themselves disdained by the courts of the Continent." Here is a curious example of the Emperor's susceptibilities:

"A young German prince [his name is not given] placed under the protection of the Austrian embassy had not had himself presented at court. I ignored the young German's presence in Paris, and he had not yet made me his visit. But the Emperor suspected me of being the cause of this abstention. To know the truth about it he sent to me Bacciochi, after having told him: 'Say to him frankly what is the matter; don't play the diplomat. . . . If you are frank, Hübner, as I know him, will be frank also.' His envoy was frank enough to repeat to me these very words. I had the prince searched for in the hotels of Paris, and I presented him to the Emperor, who received me with open arms and ceased to show me coldness for several weeks. Is this clear enough?"

A conference of the Powers took place at Vienna, and meanwhile hostilities began on the Danube between the Russians and the Turks. Hübner was conscious that the French Emperor saw only a pretext in the Turkish complications. "What," he said, "is the situation? Are we confronting a real Eastern question? No. Turkey is merely the ground on which the real question is to be raised; for England and for France this real question is the preponderance of Russia. John Bull don't want this preponderance, whatever Lord Aberdeen may say or do. . . . France cannot remain passive. . . . The progress of Russia must be stopped. This is the new phase on which we enter."

In the midst of these political considerations, we find interesting accounts of visits to Champlatreux, the château of Count Molé, to Fontainebleau. Hübner calls Fontainebleau the richest and most fantastic of all the castles of the ancient kings of France. During this visit, made with Drouyn de Lhuys, the Minister of Foreign Affairs, and Thouvenel, he found himself with Princess Mathilde and the personages of the new court. Of the great gentlemen of the country, there was but one, the Duke de Baufremont. After the dinner, served for eighty people in the magnificent gallery of Henri II., Hübner had a long conversation with the Emperor on the Eastern question:

"I then had the honor of opening the ball with the Empress. It was the eve of her feast day. The Emperor took the gentlemen to his bedroom and distributed to them bouquets of flowers. Guided by him, we then entered in procession the room where stood the Empress, and we presented our flowers to her in succession. . . . Towards the end of the evening, Drouyn de Lhuys begged me regard what his master had said to me as having the value of an official communication."

Austria, Prussia, France, and England signed in Vienna in December, 1853, a protocol which isolated Russia, and which virtually put an end to the Russian hegemony in Central Europe—a result which was but imperfectly understood in Vienna and in Berlin. It was the policy of Drouyn de Lhuys to seek in an alliance with Austria (a conservative country) a remedy against the revolutionary tendencies of his master and at the same time a counterpoise against the influence of England, personified at the time by Lord Palmerston. Napoleon was absolute master of France; his object was to undo the treaties of 1815, and an alliance of France with England against Russia was the entering wedge. England was both astonished and pleased to find the army of France at her service. The preoccupations and reflections of Hübner during the confused period of negotiation which preceded the Crimean war, and during the war itself, are full of interest, as they reflect the current state of mind in Austria. Hübner clearly foresaw that the Crimean war was but a beginning, and that the position and influence of Austria were threatened by the combined action of France and England. He prophesied that the Italian question would come into the ascendant after the Congress of Paris, which followed the Crimean war.

The first volume of his curious journal covers the years 1851-1856; it will be followed very soon by a second volume which will undoubtedly be as interesting as the first. At the end of the first volume we find Hübner's appreciation of Cavour, whom he met at the Congress of Paris.

"I like," said he, "to do justice to my adversaries, but Cavour displeased me. At the Congress he tried to appear modest. At the sitting of the 8th of April, when Walewski was, against his will, obliged to cast the firebrand of Italian affairs among the plenipotentiaries, with the knowledge if not with the approbation of the Emperor Napoleon, Cavour had the courage to attack openly Austria, whom he did not cease to attack secretly during the conferences. Strongly supported by Prince Napoleon, he was not pleased by the Emperor's constant wavering between his good and his bad instincts, between his desire to be accepted by the sovereigns and his fear of being compromised by the revolutionists. Cavour's physique is wanting in distinction."

THE FRENCH PRIMITIVES IN PARIS.

PARIS, May, 1904.

It was no doubt the successful exhibition of Flemish primitives, held two years ago at Bruges, that suggested the exhibition of French primitives recently opened in the Pavillon de Mersan at the Louvre, with a supplementary section at the Bibliothèque Nationale. One of its immediate objects, according to its organizers, is to make reparation for the long period during which these early French painters have been neglected and forgotten. The cynical, just now when critics at the Salon are declaring that there is no French art left, might see in the collection only an additional proof that there was none, as far as painting is concerned, in the beginning, and that if the French primitives have been neglected, it is because they never existed. However this may be, one thing is certain: the show has a very great historical importance; no pains have been spared to make it complete; while, when it comes to the later period represented, the sixteenth century—though then, surely, French art had outgrown all primitiveness—there is work that appeals as powerfully to the artist as to the historian or the Morellian. In a word, the show is one to be seen by everybody who happens to be in Paris before the 14th of July, when it closes—is, indeed, one worth a special journey for the special student.

As the exhibition is held in Paris, I need hardly explain that it is not only intelligently but delightfully arranged. Even the person caring nothing for the history of primitive or any other art should go, if merely to enjoy the first impression on entering from the Rue de Rivoli. For the great hall below and the stairway leading to the picture galleries upstairs are hung with gorgeous old tapestries; beautiful statues stand here and there; and masses of plants make restful spaces of cool green in the midst of the glow of color and the splendor of design. There is nothing of the tedious effect of an exhibition. It took me, at any rate, some little time to realize that tapestries and statues were there as "specimens" to be examined, lent for the occasion by private collectors and public museums, so essentially did they seem to belong to their background. Naturally, in the picture galleries, it has not been so easy to retain this illusion of appropriate decoration. Here the end would be defeated if the paintings were not grouped according to schools and periods, and hung so that they could be studied separately and comparatively.

Already the collection has aroused great national and patriotic enthusiasm; already it has been seized upon as a motive for books that are to establish the originality and preëminence of the French Primitives; already I seem conscious of busy Morellians shuffling names and attributions, and dealing them out afresh. But when the enthusiasm has had time to cool, when the game of attributions has been played, I

have an idea that the general estimate of the French Primitives will be very much what it was. At the best, the primitive art of any country, except for the rare work of the rare genius, has little beyond an historical value. And I see nothing in the present collection, to which national and provincial museums, churches, and cathedrals from all over France, collectors from all over Europe, have contributed, to convince one that the occasional genius in primitive France was less rare than has been thought; nothing to disprove the belief that what painting there then was, reveals Flemish and Italian influence rather than local character. I know it is now urged that, after all, in the early days of the Valois, Flanders and Burgundy were so closely allied as to be practically the same country, united under the same princes, the people sharing the same interests; and that if the work then done in Burgundy bear traces of what we call Flemish influence, there is no more reason for attributing it to a Flemish origin than there would be to embrace all Flemish work in one great Burgundian school. Indeed, I should not be surprised if, presently, it were urged that Flemish art really is Burgundian or French. But the fact remains that the few great painters in this part of Europe who owed their art to Flemish—or Burgundian, if you please—sources, belong to the country that once was Flanders and now is Belgium, and that they alone give the Flemish School, and indirectly the Burgundian group, any artistic importance. There are altarpieces and panels and even portraits in the Burgundian section that have all the amusing angular naïveté, the uncompromising, matter-of-fact realism, the minute detail, the homely conception of beauty, that characterized the series of pictures at Bruges; but nowhere did I discover the little more that separates the supreme genius from the well-trained craftsman—the little more found in the masterpieces of Memling and the Van Eycks. And so with the other French Schools, the sole essential difference being that, as you get further south—in Provence, for instance, where painting flourished in the fourteenth and fifteenth centuries—the Italian influence replaces the Flemish.

One or two artists may seem somewhat more accomplished than the rest—Fouquet, the painter still known as "le Maître de Moulins," though the Morellians have him in hand; Nicholas Froment. But, interesting as their work is, admirable and notable as are the examples—Froment's triptych with René and Jeanne de Laval, like donors kneeling on either side in the wings, from the cathedral at Aix; the exquisite little paintings on vellum by Fouquet; a simple portrait of a woman by the Maître de Moulins, the property of Mr. Walter Gay; the strikingly realistic head of a child, in the catalogue ascribed tentatively to Jean Bourdichon—interesting as these and other things are, I do not hesitate to say that the unprejudiced student will find nothing in the series that can be compared to the great performance of the Flemish Primitives on the one hand, of the Italian on the other. That good painting was done in France during the fourteenth and fifteenth centuries, is clear. But, despite the care and thoroughness and knowledge with which the collection has been got together, only a comparatively few known examples of note being omitted; despite the fact that never before has there been such an opportunity for an exhaustive study of the early French painters, I do not believe sufficient new evidence will be found in the work shown to persuade the impartial critic to modify his appreciation of the relative merits of the Primitive Schools of European painting; I do not believe the historian of art will see any reason to rewrite his history.

Coming down to a later period, it is another matter. It may be stretching a point to include in an exhibition of Primitives men like Corneille de Lyon, Jean and François Clouet, and the artists who worked at Fontainebleau with the Italians summoned to France by François I. But no one can regret that that point has been stretched, at least in the case of the Clouets and their disciples. For here a stage is reached when a school of French painting with a distinct character of its own had been developed; and though it may be proved that Jean Clouet happened to be born in Flanders, his work must still be ranked as essentially French. Some of the portraits by him and by his son François are so Holbein-like in their beautiful flat modelling and in their design—in the way the head is placed on the canvas or the little flower is held in a hand—that it is no wonder if now and then one of them has been attributed to Holbein. But the resemblance is more or less superficial, and the French characteristics become more and more marked. Art in France, or rather painting, never found its most sympathetic outlet in religious subjects and for religious purposes, as it did in Italy and Flanders; and it was inevitable, from the very nature of the French genius, that its first fine flowering should have been in portraiture. Many of the most beautiful and famous examples are here: that wonderful little portrait of Elizabeth of Austria by François Clouet from the Louvre; the man holding the volume of Petrarch from Hampton Court, lent by King Edward; panels—portraits of men and women—from Versailles and private collections, by Corneille de Lyon, that now, seen together, make one realize as never before what a fine master he was. But perhaps even more beautiful are the drawings, the wonderful Clouet drawings in crayon, little more than outlines, with the occasional touch of color, but so strong in the rendering of character, so learned and exquisite in draughtsmanship. With this school of portrait painters to boast of, there seems the less need for French historians to be so eager in their desire to reconstruct for themselves a native school of Primitives. Of the work by the Fontainebleau group, I say nothing. It really is out of place in the present collection. And, besides, in it is felt not so much the influence of Italy as the deliberate imitation of Italian masters—if, indeed, the few pictures catalogued as by the School of Fontainebleau were not actually painted by Italians.

I have so far spoken entirely of the paintings, because more space is given to them, and more attention is paid to them in the admitted desire to recall and reinstate the neglected and the forgotten. But if the French people waited to produce a school of painters of their own, they evolved a great school of sculpture almost as soon as a great school of architecture. The sculpture, however, is less easy to represent in an exhibition of this kind, for the simple reason that architects and sculptors in those early days worked together in such intimate coöperation—the art of the sculptor supplementing and completing the art of the architect—that to do justice to the sculptors would be to strip half the cathedrals and churches of France of their most glorious ornament. A number of statues are scattered through the galleries, some in stone, some in wood, most of them tinted and gilded, or, rather, with a little of the old color and gilding clinging to them still. But they give a mere suggestion of the work in which, as all France testifies, the early artists of France triumphed.

I have referred to the tapestries exhibited. There are also fine enamels and marvellous illuminations. And, as the old mural decorations are no more available for purposes of exhibition than the old sculptures, a number of copies of the most ancient frescoes or wall paintings in the country have been lent from the "Monuments Historiques" collections, and hung together in an upper room. Moreover, to round out the exhibition more completely, as the space in the Pavillon de Mersan is limited, and as transportation was too great a risk for certain of the nation's treasures, the new room at the Bibliothèque Nationale has been used for the display of a marvellous series of early illuminated manuscripts and books. It is here that Jean Fouquet is seen to even better advantage.

I should add that the catalogue is exceedingly well done, the descriptions exhaustive, the illustrations representative; in every way, the model of what a catalogue should be. Altogether, the organizers of the exhibition—who have the Ministre de l'Instruction Publique as their President and M. Henri Bouchot of the Bibliothèque Nationale, to whose incentive the show is due, as their Secretary—are sincerely to be congratulated.

N. N.

Correspondence.

RUSSIA AND THE NORTH.

To the Editor of The Nation:

Sir: The question whether the friendly attitude of Russia during your civil war was helpful and welcome to the North might, I believe, be settled by reference to your journals of that date. The British Government was, from the beginning and throughout, resolved on neutrality, and needed no demonstration on the part of Russia or any other Power to confirm it in that resolution. But the attitude of Russia was probably somewhat helpful to it in resisting the efforts of the party in its own country which was striving to force it into intervention. By the Emperor of the French, intervention was certainly desired; on him the attitude of Russia could hardly fail to produce its effect. It did not strike me, or I think any of us, at the time, that there was anything affected or insincere on the part of Russia. It was natural that she should sympathize with a Power entirely friendly to her and not likely to be otherwise, against the Powers with which she had recently been, and might again be, at war. It is not by the jealousy of

the United States that she is blocked at the Dardanelles and wherever she tries to make her way to an open sea. She has nothing to fear from the contagion of your republican institutions. Her policy has, of course, been decided by objects of her own; but it may, nevertheless, have led her sincerely to desire friendly relations with the United States.—Yours faithfully,

GOLDWIN SMITH.

TORONTO, June 11, 1904.

Notes.

Houghton, Mifflin & Co. have completed their plans for the preparation of a new series of works on "The Types of English Literature," under the general editorship of Prof. W. A. Neilson of Columbia University, recently of Harvard. The following assignments have already been made: "The Ballad," to Prof. F. B. Gummere of Haverford; "The Novel," to Dr. Bliss Perry, editor of the *Atlantic Monthly;* "The Lyric," to Prof. F. E. Schelling of the University of Pennsylvania; "Tragedy," to Prof. C. H. Thorndike of Northwestern University; "The Pastoral," to Prof. J. B. Fletcher of Columbia University, recently of Harvard; "The Essay," to Dr. Ferris Greenslet of the *Atlantic Monthly;* "Character Writing," to Mr. C. N. Greenough of Harvard; "Saints' Legends," to Dr. G. H. Gerould of Bryn Mawr; "Allegory," to the general editor. Other volumes are being arranged for, and the series will cover ultimately the whole field of English literature.

Mr. D. B. Updike, Boston, announces an elegant quarto edition of Ascanio Condivi's Life of Michelangelo (1553), translated and embellished (even to the designing of a special fount of "Montallegro" type) by Herbert P. Horne. Out of 275 copies, 230 will be for sale.

Mr. Hector Macpherson, the author of a life of Adam Smith, has prepared a condensed edition of the 'Wealth of Nations' (T. Y. Crowell & Co.). As Adam Smith entitled some considerable parts of his book digressions, the work of condensation is so far simplified; but, as this edition can contain scarcely a third of the original matter, many things are omitted which will be missed by those familiar with what Smith wrote. The editor observes that much of the historical illustration—the combination of which with general principles, as Mill said, had such happy results—has become obsolete. But principles can be made clear by old facts as well as by new ones; and they are not made clearer by omitting the old without substituting the new. Still, the work of selection seems to have been done with intelligence; and as the 'Wealth of Nations,' although extremely interesting, is probably so bulky as to deter many readers, an epitome may be of service. If Mr. Macpherson's book has the effect of sending those who read it to the original, it will justify its appearance.

The Hon. T. A. Brassey offers the public a collection of his writings and addresses, entitled 'Problems of Empire' (London: Arthur L. Humphreys). The book is handsomely printed and bound, but the contents remind one of President Edwards's description of his body, as composed of flaccid solids and vapid fluids. Such feeble support as this may well make Mr. Chamberlain despair of his cause. Mr. Brassey seems really unable to comprehend the nature of an argument, and his utterances amount to nothing but expressions of opinion.

We may contrast with Mr. Brassey's sumptuous volume Mr. Edward Pulsford's plainly printed and bound 'Commerce and the Empire' (Cassell & Co.). Mr. Pulsford represents New South Wales in the Australian Parliament, and is a vigorous champion of the cause of free trade. In spite of the lapse into protection which followed federation, he is confident that the English colonies will adopt the policy of the mother country; and he certainly gives abundant reasons for their doing so. While his book is addressed primarily to Australians, it is of universal value on account of the able handling of the statistical information which it contains. Perhaps nothing better fitted to make clear the fiscal controversy has yet appeared. Mr. Pulsford suggests that it would be more correct to speak of "penalized" than of "preferential" trade, and that the word "restriction" be substituted for "protection." John Stuart Mill employed the word "restrictive" in speaking of protective tariffs, and it is certainly a more accurate expression than the one in common use. This work deserves a place in public libraries as well as in those of economists.

The third volume of 'Watertown [Mass.] Records' contains the town proceedings from March, 1727, to March, 1822. These have the familiar physiognomy, and possess now chiefly a genealogical interest. We meet again with the town's vigilance against newcomers likely to become a charge on the community, and their expulsion; the care of the infirm and poor; the differences over the location of schoolhouses; the license for swine to run at large, and for horses ("without fetters," "without being well fettered"); the laying out of town ways, and perambulation of town boundaries; the repair of the minister's house, the church, the Great Bridge over the Charles River. A single item is exceptionally curious, anno 1734, when it was voted that for one year no townsman should "presume to carry any Wares or Provisions" from Watertown and "Expose them to Sale, in the Markets that is Voted by the Inhabitants of the Town of Boston to be Set up there." The fine was twenty shillings; the pretext, that Boston's setting up a market "by many is thought will prove prejudicial to people in the Country." So the protectionists carried the day. The name of Garfield is prominent in these records, but does not occur in the list of births, deaths, and marriages filling half this volume, and ranging from 1738 (after the division of the town) to 1822.

'The American Natural History,' by William T. Hornaday (Scribners), a large volume of 449 pages and many illustrations, is primarily for use in schools. Mr. Hornaday maintains that isolated facts in natural history, no matter how fascinatingly presented by the teacher, have no permanent educational value except to awaken interest in young pupils, and need to be dovetailed in some rational system that demonstrates their relations and converts them into available sources of knowledge. In the present book, intended for school instruction intermediate between college "zoology" and the "Nature Study" of the lower grades, the author has aimed to sacrifice neither the principles of his science nor the interest of his subjects. His personal knowledge of wild animals, drawn from his experiences as taxidermist and collector of specimens for the Smithsonian and as director of Bronx Park, appears on every page, and sets his book, in worth and interest, far above the compilations of hack writers and the pleasant vagaries of many popular authors of animal stories. It is almost a dictionary of vertebrated animals of North America, from monkeys to fishes inclusive. The life history of each animal is concisely related. The author writes entertainingly of the habits of animals in captivity. Of the dispositions of the Zoo mammals he says: "Deer are the greatest fools; wolves are the meanest; apes, the most cunning; bears, the most consistent and open-minded; and elephants, the most intellectual." A highly interesting section relates to poisonous snakes and the treatment of snake bites. Every sojourner in a country infested with poisonous snakes should carry a hypodermic syringe and the necessary drugs for an injecting fluid. The section on ichthyology has much matter that will interest the angler. Hypercritical readers may find fault with some of Mr. Hornaday's work on classification, and ornithologists may think his figures for the decrease of bird life a little large; but every one must admit that his book is of much value to students of vertebrate zoology.

Mr. Ralph Hoffman, a successful teacher of the art of identifying birds without the use of a gun, has just published a book for field students, entitled 'A Guide to the Birds of New England and Eastern New York' (Houghton, Mifflin & Co.). He has prepared elaborate field keys, which regard coloration, haunts, habits, and notes of his subjects. Separate keys are provided for the different seasons. Though it is somewhat disappointing to find that the author is not in his most charming mood of sympathy with nature, still his facts—first-hand observations of an experienced ornithologist—are perhaps all the more rapidly instructive from being a little hard and concise in expression. His careful descriptions of the notes of birds especially evince the long and patient field study that has gone into the making of his book. Professional ornithologists, as well as Audubonites armed with field glasses, will find this guide valuable.

The 'Field Book of Wild Birds and their Music,' by Mr. F. Schuyler Mathews (G. P. Putnam's Sons), is the most thorough and elaborate study of American bird songs yet published. The author has been able to collect his bird music and set it down on the musical staff, "taking," he says, "no liberties with the score except to make a doubtful A or B no longer doubtful." By the employment of syllables, also, he represents well the form of various songs. In many cases he has composed piano accompaniments, making with the song themes unique and charming productions. He finds that many birds use our musical scale while others do not, and includes among the former class the purple finch. The present reviewer has failed to hear the purple finch using our scale, but, as the author says, each species has a wide variety of songs,

hence an objection based on ordinary experience has little weight.

Mr. T. Mellard Reade, author of 'The Origin of Mountain Ranges,' has brought together a series of more or less related essays, partly new, partly reprinted from professional journals, under the title 'The Evolution of Earth Structure, with a Theory of Geomorphic Changes' (Longmans, Green & Co.). Mr. Reade tries to prove that folded mountain chains arise from the recurrent heating and expansion of thick accumulations of sediment; to remove some probable misunderstandings of the earlier statement of his views; and to extend the principle of heating and expansion to the explanation of slaty cleavage. The book contains some pretty illustrations of folds artificially produced by "circumferential compression" in a round box acted upon by a "compression band." It is difficult to see how these experiments strengthen the postulate of folding by heating. Mr. Reade's thesis is an important one, however, and the worldwide occurrence of rocks showing the effects of loss of temperature by their present crystalline state demands more consideration from the author's point of view than the subject has received from working geologists.

The author, John Volk, of the unpretentious little volume recently published in New York under the title of 'Songs and Poems in Danish and English,' died a few weeks ago. He translated, apparently, with equal facility from English into Danish and from Danish into English. So we have in this selection Danish translations of poems by Longfellow, Markham, Whittier, Walker, Tennyson, Watson, Ostrander, Henry Van Dyke, Eugene Field, Warman, Kipling, Donohue, Donaldson, Tom Moore, etc., and English translations of poems by Baggesen, Drachmann, Björnson, Bögh, Grundtvig, Lie, etc., besides original productions in both languages. Readers who are interested in Scandinavian literature without being capable of first-hand study may be recommended to make the acquaintance of Danish and Norwegian lyrics through John Volk's translations. Mr. Volk is a distinct loss to Scandinavian journalism in America.

'The Issue,' by George Morgan (Philadelphia: Lippincott), is a rather impetuous narrative (of the current semi-historical type) of the ferment over slavery which begins in the short fury of the Nat Turner negro uprising in 1831, in southeastern Virginia, and continues into the civil war as far as the battle of Gettysburg, where some of the lovers in the plot find a satisfactory outcome of their perilous vicissitudes. In many respects the book shows power; the typical characters of the slave world are portrayed often in an original and seldom in a hackneyed manner. Famous historical personages (Webster, Calhoun, Clay, and Lincoln) are introduced, not always through any necessity of the fiction and sometimes with unjustifiable burlesque; sometimes also with entertaining reminiscence of their well-known traits of mind and body. Vigorous descriptions of notable battlefields, such as Antietam and Gettysburg, carry along the general sweep of the tale, which is full enough of adventure to content the most exacting of appetites for stir and thrill. Po Groudy, the heroine, has a melodramatic career, from the day when as a baby she escaped the Nat Turner massacre, through her experience as a revival exhorter among the Chesapeake 'longshoremen, thence as a Crimean nurse (of which we have only a rumor), and finally as nurse in the Union army, appearing with the customary remarkable timeliness to the needs of her friends which good novelists ensure. The lack of quiet resting-places for the reader's emotions is partly due to the rapid transitions of this young woman from one hardship to another, and partly to the procession of personages of the eccentric and villanous kind which is constantly passing across the stage of action.

The fourth number of the John P. Branch Historical Papers of Randolph-Macon College (the annual publication of the department of history) breaks off in the midst of a series of reprints from the Richmond *Enquirer* of 1816, embracing Judge Spencer Roane's opinion in the case of Hunter vs. Martin, and sundry articles of his on the same theme of State rights, "a sort of prelude to the Missouri controversy," as Professor Dodd points out. The first of three other papers in this number is a sketch of the life and Congressional activity of George C. Dromgoole, an uncompromising Virginian champion of slavery. His biographer does not spare his infirmity of drunkenness, but might have enlivened his pages by citing verbatim John Quincy Adams's sarcasm, which will do more to perpetuate Dromgoole's memory than any merit of his own.

Bound up with the Proceedings of the State Historical Society of Wisconsin at the annual meeting in October, 1903, are two papers of decided value on "Coöperative Communities in Wisconsin," by Montgomery E. McIntosh, and "Early Wisconsin Imprints," with facsimile illustrations, by Henry E. Legler.

In the April Bulletin of the Central National Library in Florence, announcement is made of a prize of $500, offered by a "signore forestiero," transparently veiled (whose Petrarch collection, we are told, ought not to run the risk of crossing the Atlantic, but should remain on the banks of the Arno), for the best work exhibiting the relations of Petrarch to his native Tuscany. The donor hopes the essay may combine literary quality with scientific research. Two hundred dollars additional will be allowed towards the expense of printing and illustrations. The essay must be in Italian, and be handed in to the Laurentian Library not later than April 9, 1905, the anniversary of Petrarch's crowning in the Campidoglio. The judges will be Guido Biagi, Guido Mazzoni, and Pio Rajna.

The Florentine bibliopole, Leo S. Olschki, has just issued a Catalogue 57 by way of supplement to his remarkable Catalogue 53, 'Monumenta Typographica,' which we noticed at the time of its appearance. These additions to his collection of early printed works are characterized with the same scrupulosity as their predecessors, and frequently illustrated in facsimile. Tables of towns and printers follow. The sole book published in Pogliano, Petrarch's 'Libro degli uomini famosi,' is among the rarities.

"O. T." writes to us: "There is a certain similarity between the names used in 'Florambel de Lucea' and those in 'Pandosto' and the 'Winter's Tale' which is possibly worth while calling attention to. I give first of all the name in 'Florambel,' accompanied by the volume and page where it occurs in Clemencin's 'Don Quijote,' then the name in Greene or Shakspere: Florineo (I, 31), Florizel; Beladina (I, 31), Bellaria; Policiano (II, 264), Polixenes; Leoncides (II, 462), Leontes; Lerinter (II, 469), Jarrinter."

—At the last meeting of the Massachusetts Historical Society, held at its building in Boston on Thursday last, Dr. Adolph Harnack of Berlin, of 'History of Dogma' fame, was elected an honorary member in succession to Theodor Mommsen. The rule of the Society as respects election to its honorary list has already been referred to in the *Nation*. In that society all the classes of membership, three in number, resident, corresponding, and honorary, are strictly limited. The charter of incorporation confines the resident membership to citizens of Massachusetts, not exceeding one hundred in number. The corresponding membership is confined to fifty, chosen at large from persons not resident in Massachusetts. The honorary membership is still further limited to ten persons chosen at large because of conspicuous eminence in the field of historic research or the production of some historical work of international fame. Dr. Mommsen was a marked example of a selection made on both grounds. He was elected in October, 1880, and at his death his name stood second on the roll; David Masson, author of the 'Life and Times of Milton,' elected in 1871, alone preceding him. Besides Dr. Masson, six other names only are now included, Dr. Harnack making an eighth. The six names are Carl Schurz (1887), James Bryce (1896), Sir George O. Trevelyan (1899), Pasquale Villari (1901), and Henry Charles Lee (1902). There are two vacancies remaining to be filled, and in connection with these the names of John Morley and Capt. A. T. Mahan have been canvassed. In this matter, however, it is the practice of the Massachusetts Society to proceed with extreme circumspection. The name of Dr. Harnack, for instance, had at the time of his election been more than six months under consideration.

—From the prefatory dedication to Mr. D. B. Updike's folio edition of the Minor Writings of Tacitus it appears that this author was chosen by Prof. Charles Eliot Norton, from among all the Latin classics, as worthy of the honor of being first printed in the publisher's new fount (designed by Bertram Goodhue). The choice is approved not only on the ground of genius and style, but because we cannot read Tacitus without some painful home reflections—"multa continet quae hoc tempore nostrae reipublicae legentes de nostra vita eiusque vitiis publicis privatis legere videamur." However, this chastening experience is less to be incurred with the Agricola, the Germania, and the Dialogus de Oratoribus than with the Annals and Histories. By so much, accordingly, one's pleasure will be less marred in viewing and perusing this noble specimen of the printer's art. Mr. Goodhue's letter has that masculine quality which insures it Mr. De Vinne's suffrage. It is well balanced, and characteristic without freakishness; archaic only in the ligated *ct* and in the hyphen (⸗). The capitals have been well studied and subordinated. A typographer's eye will be struck with the close

spacing, which does not shirk divisions at the end of the line—which even invites them. Four or five hyphens thus sometimes terminate as many successive lines, and thereby increase the task of the pressman. There are three initial letters of the proper strength and beauty, cut on wood, and we can but applaud the taste and craftsmanship to the very end, where the colophon is introduced by a filleted *capo di bove* printed in red, and the Merrymount Press is designated as "officina quae Hilarimontium dicitur." The paper is Arnold, expressly hand-made for this edition. Mrs. Whitman has presided most successfully over the binding, in olive green leather and gray boards. Prof. Morris Hicky Morgan of Harvard has superintended the Latin, filling in certain lacunæ in Henry Furneaux's text, which the Clarendon Press has courteously given permission to reproduce. Altogether, this enterprise merits very high praise indeed, with the natural regret that only one hundred copies are available for those who may covet the volume. One other observation, not supererogatory: the letterpress is readable as well as a thing of beauty in itself.

—Methuen & Co., London (New York: E. P. Dutton), have added an 'Alfred Tennyson' to their "Little Biographies." The writer is Arthur C. Benson, whose 'Rossetti' was but lately added to the "English Men of Letters" series. One gets the impression that it was written *con amore* to a degree that the 'Rossetti' was not. Its structure is looser than that of the earlier book, with no corresponding loss. The biographical part takes up 77 pages, and its principal incidents are the publication of Tennyson's successive collections of verse and particular poems. Little here is new, but our memory of many things is pleasantly refreshed. The remainder of the book is a discontinuous and anecdotical comment on the poet's mind, character, and work. Mr. Benson has helped himself liberally from the official Life, but the good things which there were scattered are here crowded close together. The best anecdotes are those which have the pungency of Tennyson's literary judgments, as where he said of Ben Jonson's dramas, "To me he seems to move in a wide sea of glue." What Tennyson thought of other poets and how they influenced him, furnishes the matter of one of the most interesting chapters. Another describes the methods of his work. Mr. Benson agrees with FitzGerald that Tennyson's best work is found in the two volumes of 1842; that what he did later was too responsive to what he conceived to be the public demand upon him for moral and religious inspiration. The treatment of Tennyson's religious temper and opinions is remarkable for its sincerity. There is no attempt to make him out more Christian than he was. The Christian dogmas had little hold on him. Passionately insistent on the soul's immortality, he drew no argument for it from the resurrection of Jesus. The limitations of Tennyson's character, his lack of sympathy, and his morbid sensibility to criticism, are not extenuated nor too much insisted on. To the technical qualities of Tennyson's verse Mr. Benson brings a trained and delicate appreciation.

—At the death in Göttingen, a year and a half ago, of Dr. Karl Dziatzko, and in Leipzig, shortly after, of Max Spirgatis, editor and publisher respectively of the "Sammlung bibliothekswissenschaftlicher Arbeiten," it was feared that this valuable series would cease. A new number (the seventeenth) has, however, appeared, published in Halle by Rudolf Haupt—who has purchased Spirgatis's publishing and antiquarian business—and edited by Dr. Konrad Haebler in Dresden, well known as the author of many important contributions to Spanish bibliography. It is dedicated to the memory of Karl Dziatzko, and has an excellent portrait of him, with a bibliography of his printed writings, in addition to two posthumous papers. One of these deals with the so-called R-printer, whom the author is inclined to identify with Adolph Rusch of Strassburg; the other is a sketch of the university library of Göttingen during the reign of Jerome Bonaparte as King of Westphalia. It was then, in the beginning of the nineteenth century, at the height of its fame. While the number of volumes on its shelves, the value of its manuscripts and rare printed books, were exceeded in other libraries, "no library possessed a collection of scientific literature brought together upon such a consistent and uniform plan." The main reason for its importance was "the relative completeness of the collection in all books of permanent value for the pursuit of learned studies." And in general usefulness and accessibility this library was far ahead of most contemporary institutions. While, for instance, the Bodleian did not admit the use of any book outside its walls, a policy which Dziatzko regrets having been adopted later for the British Museum and many other English (and, we may add, American) libraries, the students and professors of the University in Göttingen could take home a practically unlimited number of books. This practice is now common among German university libraries, but at that time Göttingen was in this respect far ahead even of them. The same liberality was extended to resident and non-resident scholars, whether with academic connections or not. The "Georgia Augusta" was in many ways favored by Jerome and Napoleon at the expense of other institutions. Its library was apparently intended by them to become for North Germany what the Imperial Library in Paris is for France. While so many German libraries were despoiled and their treasures taken to Paris, Göttingen was not only spared, but even invited to share in the spoils. With rare self-control, however, the library authorities selected only a comparatively small number of manuscripts and printed books, presumably following for the acceptance of these gifts the same principle as in their purchases, namely, to acquire only what would be immediately useful. After 1813 all these "gifts" had to be returned.

—The bibliography of Dr. Dziatzko's writings gives an interesting picture of the literary activity of a German librarian. He preserved through life his early interest in classical literature, and returned again and again to his favorite authors, Plautus and Terence. In 1872 he passed from teaching to librarianship, becoming in that year chief librarian in Breslau, in 1886 in Göttingen. The first fruit of his work as librarian was his "Instruktion betreffend die Ausarbeitung des alphabetischen Zettelkataloges," which was lithographed in 1874, and in 1886 was followed by the important "Instruktion für die Ordnung der Titel im alphabetischen Zettelkataloge der Königlichen und Universitätsbibliothek zu Breslau." He wrote for the 'Handwörterbuch der Staatswissenschaften' and the 'Real-Encyklopädie der klassischen Altertumswissenschaft' important articles on libraries and on the book trade; and for the *Centralblatt für Bibliothekswesen* as well as for his own "Sammlung bibliothekswissenschaftlicher Arbeiten," many papers on various problems of bibliography and library administration, including articles on the recent movement for a universal bibliography and on the international relations between libraries. The subject with which his name is perhaps most closely identified is the invention of printing. In 1895 he wrote an excellent summary of what was then known of Gutenberg, and two numbers of the "Sammlung," the second (1889) and fourth (1890), were entirely confined to this question. In the former, entitled "Beiträge zur Gutenbergfrage," he published the long-lost Helmasperger notarial instrument of November 6, 1455, which he had discovered among the manuscript rarities in Göttingen; and the latter, "Gutenbergs früheste Druckerpraxis," is a minute study of the thirty-six and forty-two-line Bibles. These researches were carried on in the bibliographical seminar which he conducted as professor of "Bibliothekshilfswissenschaften." He soon felt the necessity of having under absolute control a medium for publishing shorter contributions to bibliography both of his own and of his students, and therefore began to include in his "Sammlung" a "series within the series," under the title, "Beiträge zur Theorie und Praxis des Buch- und Bibliothekswesens," afterwards changed to "Beiträge zur Kenntnis des Schrift-, Buch- und Bibliothekswesens." He published seven of these miscellaneous numbers; the present, the eighth, will be the last, and in future each number of the "Sammlung" will contain a single monograph.

—We put out incessant efforts through missionaries to improve the morals of the Chinese and other Eastern nations, as well as elsewhere; why should not as great, perhaps greater, effort be made to improve their sanitary arrangements? An observer at Mongtze in Yunnan, on the Anamese border, Georges Barbézieux, physician to the French Consulate, remarks in his report to the Chinese Imperial Customs that the state of the Chinese is well described in reports and documents sent by the officers of European Governments to the home office; but what is done in a sanitary way in London, Paris, St. Petersburg, New York, is not known to the Chinese, nor do the reports of European officials among them (such as his own) get back to them. In a few large cities like Shanghai, Canton, Tientsin, Hankow, the European quarters are built on the model of Western countries, with wide, well-lighted streets, networks of sewers, a sort of embryonic municipality with its different boards. But beside this lies the Chinese city in all its filth, and in the smaller places the Europeans live as the Chinese. If reports about China, so far as they offer suggestions to the Chinese, were translated and then spread broadcast in China in the form of tracts, with a special dis-

cussion of matters of public hygiene, some improvements would begin to follow, and pestilences that now have free scope among them would begin to disappear. The Chinese notables can be trusted to know a wise suggestion when they hear it, and from them instruction can filter down through the lower strata.

—Dr. Barbézieux thinks it a matter of international concern that the Chinese should not bury their dead at the level of the ground, in half-open winding sheets, and sometimes in simple mats; for we have in these customs a vehement cause of the spread of some epidemics. In Mongtze, corpses and carrion are abandoned to wandering dogs and birds of prey; swine and fowl defile the soil; filth remains in the house; lepers elbow decent people on the street, even put up at the same inn with them and share the same bed. Europeans bear with Chinese manners because they are few; but when railroads and other improvements now under way bring in a greater influx of civilized people, these old customs would become dangerous and an international menace. Perhaps it is too much to expect, with Dr. Barbézieux, permission to introduce mixed tribunals in China and elsewhere in the interest of sanitary science, as has been allowed in old times in the case of crimes; but missionary enterprise in this line by means of instruction and the printing-press needs to be encouraged. The aged Empress might perhaps be induced to send some of her young men to Europe or America to train themselves for professors of sanitation.

LIFE IN THE ANTHRACITE REGIONS.

The Slav Invasion and the Mine Workers: A Study in Immigration. By Frederic Julian Warne, Ph.D.; Philadelphia: J. B. Lippincott Co.

Anthracite Coal Communities: A Study of the Demography, the Social, Educational, and Moral Life of the Anthracite Regions. By Peter Roberts, Ph.D. The Macmillan Co.

That two books should be published almost simultaneously on the Slav invasion, as bearing on the strike question in the anthracite regions, is hardly accidental. The little book by Dr. Warne covers a wider range than does the very minute treatise by Dr. Roberts on the population of the anthracite field, for it describes both the life of the foreign workers in that field and the successful organization of miners and operators created in some of the bituminous coal States to reconcile differences and adjust wages at joint annual conferences. Both authorities write from intimate acquaintance with the people and the subjects of which they treat, Dr. Roberts being a Congregational minister in Mahanoy City, Pa., and Dr. Warne having been a correspondent of the Philadelphia *Ledger* in the strikes of 1900 and 1902; and both approach the subject without any strong, distorting bias, though Dr. Warne evidently hopes for and expects more from the influence of trade unionism than does the clergyman.

A study of the social conditions existing among the representatives of the twenty-six nationalities that constitute one of the most complex of the many cosmopolitan communities which make up the fabric of our national life, would at any time be interesting, but is, in the existing unsettled state of the labor market, peculiarly acceptable. Dr. Roberts's present work is supplemental to a book published by him on 'The Anthracite Coal Industry' before the great strike of 1902, and which we reviewed before the memorable struggle between the owners and transporters of hard coal and the miners of that fuel began. In that review we pointed out the risk which the whole country ran from the employment of ignorant laborers from central and southern Europe, who, although consisting in large measure of "men and boys who cannot speak or understand English, . . . are eager to join the union and ready to submit to the consequences of a strike; but, as might be expected, exercise less self-reliance and show less respect for their non-union fellow-American than does the American unionist; and therein lies the danger." What happened during the summer and autumn of 1902 was simply a realization of what every student of the economic and social conditions of the anthracite region anticipated; and, unfortunately, few regard the settlement of the dispute made by the President's Commission in any other light than as a compromise making a truce between the contending parties possible. As long as the foreign population of the anthracite region constitutes a coherent unit, foreign in its language and habits to the people that surround it and to the managers of the corporations for which it works, and as long as the means and facilities for transportation are owned by companies enormously overcapitalized, and which must make large profits, over and above the bare cost of production and carriage, in order to pay even their fixed charges, there are present elements of strife which may break forth into hostility at any moment.

Since 1892, prosperity has abounded and cold weather has prevailed. The extraordinary demand for coal has therefore kept the miners busy, and the wages are satisfactory as long as the miner works full time. It is when his annual income is restricted through the number of working days being reduced to 180, as was the case in the hard times, that the pinch of poverty is felt, and discontent and jealousy find expression in strikes, accompanied by violence. Dr. Peters pointed out in his first book that if the coal companies carried stocks over the dull season of the year to supply the market when the demand is brisk, and thus gave continuous employment to the miners, steady work would be secured to 110,000 mine hands, instead of intermittent employment to 140,000, and thus one of the chief causes of friction would be removed. It is true that the minimum number of hands would not have sufficed to produce the large tonnage demanded by the consumption of 1903. But that demand was abnormal, owing to the shortage of stocks resulting from the strike, which had to be replenished all over the Eastern States, Canada, and the Middle West. Some such remedy must, however, be adopted, even if the cost of this precious fuel is to be thereby increased; and by reason of this and other causes it is almost certain that the price will rise instead of decline. The available quantity of anthracite is so small that it will be exhausted during this century, but as no substitute has been as yet discovered, the demand for this smokeless fuel will grow, even though, from higher cost of mining it from thinner veins and greater depth, and the payment of better wages, the actual cost of production will increase. Meanwhile, the owners, in their efforts to hasten the amortization of their inflated capital, as the time of exhaustion approaches will not unreasonably endeavor to secure a larger margin of profit than even at present. The anthracite problem is therefore complicated by other factors than the unfortunate employment of Slav labor, although this dangerous feature is of the utmost interest to the public, in view of the smouldering labor troubles which threaten to break forth into flame in all of the twenty-eight coal producing States, except in the ten where the United Mine Workers of America and the mine owners have reached an agreement.

The Slav immigrants drift in larger numbers to coal-mining and coke-making regions than to any other scene of occupation; and though the Slavs of the anthracite and Eastern and Western coal-fields do not occupy a lower plane, socially and intellectually, than the immigrants of the same nationalities scattered elsewhere through the country, their concentration in such large numbers in these mining communities makes their objectionable peculiarities more conspicuous and their influence more dangerous. The description given by our author of their manner of life, their low morality, their abject superstition, descending even to the practice of magic, justify the author's conclusion

"that the Slav immigrants which furnish the cheap labor needed in the development of the thinner veins of coal, and which supplied the operators with men willing to work under conditions which labor of a higher grade resented, represent possibly the lowest grade of European workman which can be imported; for, Congress being in its present frame of mind, it is not likely that Orientals will supply operators with labor still cheaper, which would displace the Slav as he has displaced the Anglo-Saxon, the Celt, and the German."

That they likewise fill the worst-paid positions is true, and is due to their ignorance and inferior capacity, even when compared with the immigrants of Southern Europe. The Italians in our West readily secure employment as miners, while the Slavs are willing to do the drudgery work above ground which the Italian rejects. Looking over the pay-roll of a Western mine which employs very few foreigners, we find that underground there are sixteen Italians employed and only three Slaves, while thirty-one Slavs and only seven Italians accept more poorly paid surface work. Strange to say, notwithstanding the faculty which the educated Slav evinces in acquiring foreign languages, the uneducated Slav is slow in picking up English, and does not value the privilege of citizenship as highly as some of the nation's other guests. In the community above referred to, only two or three have been naturalized. The Census of 1900 shows that more than 50 per cent. of the immigrants designated as Slavs remain aliens, although this large proportion may be due in part to the late arrival of so many of this most recent group of accessions to our population.

To the Slav, as to all the immigrants from

central and southern Europe, trade-unionism is congenial. Most of them belonged to secret and political societies in Europe, and are therefore apt pupils of the most extreme preachers of the ultra doctrines of the anti-capitalist; but, as Warne argues in his 'Slav Invasion,' "association with the English-speaking miner in the United Mine Workers' Unions is the one influence strong enough to draw him out of his isolation, and bring him into contact with the thoughts and aspirations of his American fellow-laborer." Still, it is to be regretted that his first education in American institutions should be under the tuition of the leaders of trade-unionism, nor can it tend to the real advantage of moderate trade-unionism that its ranks should be recruited largely from such material. It was the irrepressible and riotous conduct of this group of miners during the anthracite strike which brought discredit on the more self-controlled followers of Mr. John Mitchell.

What influences first introduced Slav immigration to enter the country and drew it towards the anthracite regions is not very clear, but the stream of immigrants, once it sets in, always follows the channels cut by the first rush of population. The earliest so-called Slav immigration was towards the anthracite region after the suppression of the infamous Mollie Maguires and of the more legitimate efforts at labor organization such as the Workingmen's Benevolent Association, in the seventies. It commenced flowing when unionism was at its lowest ebb, and when, therefore, unrestrained labor competition was in full play, and when, owing to depressed trade conditions, the coal operators were seeking for labor of the very cheapest kind.

These causes alone do not, however, always account for the concentration of certain groups of immigrants in certain regions. Congeniality of climate and scenery with the antecedents and tastes of the settlers have often determined the deflection of certain nationalities to certain districts. For instance, the Upper Peninsula of Michigan and the neighboring regions of Wisconsin and Minnesota more nearly resemble Finland than any section of our very diversified country, and it is therefore hardly due to accident that more Finns have during the past forty years sought employment there than elsewhere, and have settled for so long a period and in such numbers that a handsome Finnish College, where a higher education is given to the youths of that nationality and theological students are trained for the Lutheran Church, has been built, and is well supported, in Hancock, Mich. It is significant that though these hard-working citizens, unlike our transient Italian population and many among the Slavs, have no intention of returning to Russia, the Finnish language is used in their college.

Objectionable, however, as may be the Slav immigrants, and difficult as may be their assimilation into the body politic, they have come in great numbers, and will continue to come. Professor Giddings, in a recent paper read before the American Association of Political and Social Science, describes the successive waves of immigration as follows:

"The total estimated alien immigration to the United States from 1776 to 1820 was 250,000. The total number of arrivals for the fiscal year ending June 30, 1903, was 857,046. This is the greatest number that ever applied for admission in a single year. . . .

"The character of these arriving aliens, however, during the past year, differs greatly from that of 1882 and the years previous. Since the foundation of our Government until within the past fifteen years, practically all the immigrants came from Great Britain and Ireland, Germany and the Scandinavian countries, and were very largely of Teutonic stock, with a large percentage of Celtic. Fifteen millions of them have made their homes with us. In fact, they have been the pathfinders in the West and Northwest. . . .

"The character of our immigration has now changed. During the past fifteen years we have been receiving a very undesirable class from southern and eastern Europe, which has taken the place of the Teutons and the Celts. During the past fiscal year nearly 600,000 of these have been landed on our shores, constituting nearly 70 per cent. of the entire immigration of the year. Instead of going to those sections where there is some need for farm labor, they congregate in the larger cities, mostly along the Atlantic seaboard, where they constitute a dangerous and unwholesome element of our population. The question that individually and vitally affects the interests of our people is: What shall we do with the thousands that are admitted?"

Professor Giddings's remedy is that the Bureau of Immigration should deflect the arrivals to localities where conditions are favorable, so that the tide of immigration will be directed to open and sparsely settled country. It will be found, however, that the arrivals will not consent to be deflected. Every immigrant follows a kinsman or a fellow-townsman to a locality where he has already secured employment, and thus one colony will consist of men from Servia, another from Dalmatia, another from Montenegro.

Our immigrants will unavoidably come from Southern Europe, for every other section of Europe has been drained. Nor can we do without them; for, even if the birth-rate of Americans and aliens of the second generation were maintained up to the normal standard, which it is not, the natural increase in population would not supply the extraordinary labor demand which the development of our national resources will certainly make, and therefore we must for many a decade to come look for its replenishment to the foreign labor markets of the world.

If we must reject Professor Giddings's remedy as a relief from the risk which the country runs from this large influx of undesirable immigrants, and if we must regard trade-unionism as at the best an equivocal school for the education of foreigners into the ways of free and intelligent and independent American citizenship, to what influence must we resort? The Church and the public schools are the most available agencies; but neither reaches the unmarried Slav, for he has no children, and he brings his priest with him. The responsibility therefore rests with the employer, who should put the means of decent living within his reach, and should supply him with wages sufficient to maintain more than a mere existence, and dwellings where the decencies of life are not habitually outraged; and then with the State, which should compel him to use the sanitary and other elevating means which his employer should provide. We are face to face in this Slav immigration with no common danger, and therefore the usual *laissez-faire* methods of refusing to interfere with one's neighbor and one's workmen's affairs are not applicable. The wise employer of labor should refuse to engage a low and dangerous class of employees unless compelled to do so by the dearth of any other; but, if he must depend upon them, common prudence would dictate that he take other precautions to protect himself and his property than he need resort to when his interests are entrusted to responsible native labor; and no precautions are so efficacious as fair wages, steady work, healthy homes, and a cheerful environment.

Outlines of the History of Art. By Dr. Wilhelm Lübke. Edited, minutely revised, and largely rewritten by Russell Sturgis. Dodd, Mead & Co. 1904.

As stated in the preface to the present edition, Lübke's 'History of Art' was first published in 1860, and the eleventh (a revised) edition was published in 1891. The basis of the present translation is that made in 1877 from the seventh German edition. Mr. Sturgis goes on to say:

"Since 1891 much has been added to the scholar's knowledge of archæology and to the critic's perception of artistic truth, but since 1860 the whole point of view has changed. The history of art which is possible to-day was unthinkable in 1860; many assumptions have been proved untrue; many known facts have wholly different explanations now from those once thought sufficient. The amount of added fact is incredibly great and important."

The book seemed, then, to its American publishers, so far antiquated that it needed a thorough revision, and the incorporation of the new matter with the original text seemed to them likely to secure a better result than would a system of copious annotation that should constantly contradict the statements of fact or opinion in the body of the work. To quote Mr. Sturgis again:

"This has been done with the single desire to make the book what Dr. Lübke would probably have made it had he been writing in 1902, and in America. . . . Expressions of opinion have been modified in one case and left unchanged in another; the attempt having been always not to substitute the present writer's views for those of the German author, but to modify the thought of the original as would seem inevitable in view of the discoveries and the critical studies of the last forty years."

Two typical instances are specified. Dr. Lübke's admiration for the Carracci and his lukewarmness to Correggio might conceivably be the same to-day, and consequently their expression is left unaltered; his conception of the reasons for the differences between Greek and Indian art could but be modified by our present knowledge of the Oriental mind, and therefore this part of the book is recast.

Any system of revision that could be adopted has its advantages and its drawbacks. That which has been adopted gives us a continuous and readable text which should be much more useful from the correction of outgrown errors, but it has the disadvantage of leaving us constantly in doubt whether we are listening to the nineteenth century or the twentieth, to the German doctor or the American architect. Without an elaborate comparison of editions, which few will have the opportunity

or the patience to make, it is impossible to tell what is Lübke and what is Sturgis, or which opinions are the best attainable and which are merely still tenable. Perhaps no one was better fitted for the difficult and ungrateful task which it has been attempted to perform than Mr. Sturgis, but we could find it in our heart to wish that he had either given us an accurate translation of Lübke's last authorized edition, with his own comments in the form of notes or appendices, or had frankly recast the whole, so that nothing might remain which should not represent the best critical judgment of our own day, if not precisely the personal opinion of the editor. The first procedure would have given us Lübke together with the necessary caution against his errors; the second would have given us a wholly modern book. What we have is neither quite flesh nor altogether fowl.

The edition of Lübke with which the reviewer has been most readily able to compare the present one is that published in London by Smith, Elder & Co. in 1868, the translation being by F. E. Bunnètt. The most conspicuous difference in the two is in the considerably greater bulk of the new edition, as it contains nearly a quarter again as many pages as the older one; the exact figures being 1,145 pages, against 922. Of the 223 added pages, seventy are given to the last chapter, on "Art in the Nineteenth Century," and forty-eight to the first two books on the "Ancient Art of the East" and "Classical Art," and it is reasonable to suppose that it is in these parts of the work that the greater number of changes and additions have been made, either by Lübke himself in his later editions, or by the present editor. There are, however, changes or additions throughout as far as we have examined. Sometimes they are made in a rather awkward way, as where the first mentioned of the Correggios in the Dresden Gallery is "a most tender and charming little picture of a Magdalen (the authenticity of which has, however, been recently denied)," or where two pictures are mentioned as characteristic of Giorgione and described with some care, only to be dismissed with the statements that "this has recently been denied to be the work of this master" and that "this picture is with justice, however, now no longer credited to Giorgione." In spite of some expansion, the section on Japanese art seems to us to be still singularly inadequate. An important transposition places Nicolò Pisano, Cimabue, and Duccio where they belong, in the "Gothic" rather than in the "Romanesque" period.

The increased bulk of the new volumes is partly due to the addition of some illustrations in the text from various sources, but of the same general style and quality as the old ones, and partly to the inclusion of a hundred-odd full-page plates. Modern methods of illustration differ from those in use in 1860 even more than modern criticism and connoisseurship differ from those which then prevailed, and the contrast between these new half-tone reproductions from photographs and the old woodcuts is startling. In some half-dozen instances the plates duplicate, in subject, the woodcuts, and it would have been cleverer in these cases to leave out the old cuts—they only serve to throw doubt on all their companions by the shocking discrepancies they display when compared with the plates. One has only to glance at the two versions of, say, Michelangelo's "Creation of Man," Giorgione's "The Concert," Holbein's "Meyer Madonna," Rembrandt's "Syndics," or Troyon's "Oxen Going to Work" to be astonished at what used to pass muster as an illustration of a great work of art.

These are all reproductions of paintings, and it might be thought that sculpture and architecture would suffer less by the woodcutter's translation. Certainly these arts are more adapted to expression in line, and, in the case of architecture, the linear treatment would have an advantage in its greater clearness if only one could trust its accuracy. To be convinced that the sculpture is little better treated than the painting, however, one has only to compare the old and new cuts of Michelangelo's "Moses"; while that the old manner of illustrating architecture left something to be desired, may perhaps be gathered from the fact that more than half of the new plates are devoted to architectural subjects. To be sure, this may have arisen from the editor's special interest in the art he has himself practised, but if the old illustrations had been more satisfactory, one imagines that so many new ones would not have been needed. It is especially in its illustrations that we regret that the book could not have been thoroughly modernized.

Opposite each of the full-page plates is a note printed on the tissue paper guard, and these notes are the only parts of the book that are quite certainly by Mr. Sturgis. They are so conspicuous that any errors they may contain are the more likely to attract attention, and it is in them that we have noticed some of those slips of the pen or the types that are sure to occur in such a work; and we note a couple only that they may be corrected if opportunity offers. Donatello's "St. George" is attributed in the note to Verrocchio, though the legend under the plate gives the correct attribution; and the Darmstadt version of the "Meyer Madonna" is spoken of as a "duplicate or early copy," though the text states, what is the general opinion, that this picture is the original, that in Dresden being somewhat inferior to it. In the present state of criticism it is surely rather daring to describe "The Concert" in the Pitti as "undoubtedly by Giorgione."

Each volume has, besides the half-tone plates and woodcuts, a frontispiece lithographed in colors. They are both from architectural restorations in the Metropolitan Museum; that of the first volume representing the temple of Karnak, and that of the second the Parthenon. We confess to some curiosity as to the meaning and origin of the extraordinary design stamped on the back of the cover.

Everything considered, the book is vastly the better for its partial rejuvenation, and perhaps there is nothing superior of its kind to be had at present, but it is still far from what a general history of art might and should be if undertaken afresh with modern knowledge, modern insight, and modern means of illustration.

The Code of Hammurabi, King of Babylon (about 2250 B. C.). By Robert Francis Harper, Ph.D. Chicago: The University of Chicago Press. 1904. Pp. xv, 192, with one photograph and ciii plates.

In the winter of 1901-02 the French archæological expedition to Persia under M. De Morgan found, on the necropolis of Susa, three pieces of a large stele of black diorite, containing a law code of the famous Babylonian King, Hammurabi, the most important discovery in the field of Assyriology since George Smith's publication some thirty years earlier of a fragment of a clay tablet containing the Flood legend. The inscription was published with commendable promptness and in fine form, thanks to the liberality of the French Government, in the Memoirs of the Expedition, in 1902, with beautifully clear photographic reproductions of the text. On the basis of this work, translations speedily followed in German and in English, as well as numerous articles and booklets discussing the bearings of this code on the history of civilization in the East, and particularly its relation to the law of Moses. The volume before us is more elaborate and more carefully prepared than these earlier publications. It contains an autograph text of the inscription, originally published in the *American Journal of Semitic Languages and Literature* in October, 1903, "reconstructed and edited from the photographs published by Scheil" in the memoir referred to above, a transliteration of the same in Roman letters, with a translation on the opposite page, a glossary which notes every occurrence of each given word, with the exception of a few particles, and a very elaborate index of subjects. As appendices, we have lists of all signs used, with their transliteration in two forms, one giving the character actually used and the other the dictionary form of the same character; a list of numerals; and, as justification of certain readings, a "list of scribal errors," showing in one column the sign which actually appears in the inscription and in the other the sign which Professor Harper believes should be read in its place; together with a "list of erasures," where the scribe, perceiving his own error, has erased the sign first written and substituted another. At the close of the volume is a decidedly sketchy map, the mountains on which look as though they had been thrown in haphazard. There is no commentary, and the very brief introduction contains no discussion of the origin, development, or use of this remarkable code. A second volume is promised, by the brother of the editor, President William R. Harper of Chicago University, which will discuss the Code of Hammurabi "in its connection with the Mosaic Code."

In regard to the transliteration, Professor Harper says of his own work that an edition of an Assyrian or Babylonian text which is to be final must go back to the originals. This is undoubtedly so. Nevertheless, the photographs of Father Scheil were so beautifully clear and accurate that Professor Harper has been able to produce from them an autographed text which will presumably need very little emendation to make it perfect. The translation seems to us to leave still much to be desired. It is literal, in the sense that it aims to reproduce the Babylonian word for word, so far as that is consistent with intelligible English, and to translate any given Babylonian term systematically by one and the same English word. This method of translation only makes more clear the fact that there are

yet many places which are not altogether intelligible, especially in the case of those laws which deal with the privileges and duties of certain classes of public officials. However, in general the meaning of the laws is perfectly clear, and most of the details also.

It is worthy of note that, except in a very few places, as, for instance, at the commencement of the Code (according, at least, to Professor Harper's translation), there is no trace of the arrangement of the laws in any of those systems so common in ancient codes, of pentads, decalogues, or the like. On the other hand, these laws are codified by subjects more systematically than is usually the case even in codes much less ancient. The laws, approximately 280 in number, are all case laws, introduced by the word "if" or "in case" (*summa*), what in the phraseology of old Hebrew legislation were called "judgments." Both this outward form, and also the contents of the laws, which reveal a high condition of social and economical development, make it clear that, in spite of the fact that this is by many centuries the oldest code of laws heretofore discovered in any country, there nevertheless existed before the time of Hammurabi a long line of legal precedents, and presumably a number of different codes of jurisprudence. The work done by Hammurabi in formulating this code was evidently very similar to that done by King Alfred in England in his famous "dooms." He gathered together the various dooms or judgments sanctioned by the kings of various cities, and out of these formed a body of laws for his entire empire. This code of laws was an important factor in that unification of a Babylonian empire which took place under his reign; and an incidental reference to "the laws of Aleppo" in the prologue suggests that the influence of his legislation, as of his empire, extended beyond the limits of Babylonia. Since Professor Harper's work was put in print, the interesting suggestion has been made that a clause near the end of that prologue (i-na pî ma-tim; literally, "in the mouth of the country"), means that, contrary, probably, to earlier use, these laws were published "in the language of the people," that they might be understood by all, and not by the priests or lawyers only. We would suggest, as a variant of this proposition, that the phrase may mean that they were now published, whereas they had been hitherto preserved by oral tradition.

The present volume is an admirable foundation for the study of the text of these laws. It is to be hoped that the succeeding volume, by President Harper, will give us a satisfactory analysis of and commentary on their contents, together with a comparison of Hammurabi's laws with the laws of Moses and a discussion of their relation to one another. The mechanical execution of the volume is beautiful—heavy paper, broad spacing, clear type—leaving nothing to be desired.

The Song of Roland. Translated by Isabel Butler.

Beowulf and the Finnesburh Fragment. Translated by Clarence Griffin Child. Boston: Houghton, Mifflin & Co. ("The Riverside Literature Series," Nos. 157 and 159).

There is much worse summer reading than the mediæval epics, 'Beowulf' and 'Roland,' which are now to be had by school children and discerning grown-ups in the inexpensive "Riverside Literature Series." These two heroic poems make an excellent brace if only for their contrasts, corresponding to the deepest sentiments of the two stocks in which they were sung. The 'Roland' is all clarity, reasoned patriotism, and religious certitude. The reader moves in a world of great affairs conducted by emperors and bishops, menaced only by paynims who are generally beaten, and traitors who are condignly punished. Everything in the great poem is social and national. Tallifer most appropriately sung it as he rode at the Hastings palisade. The 'Beowulf,' on the contrary, is all mystery, personal punctilio, and religious ambiguity. Its world is one of morasses inhabited by the brood of Cain, of dragons' treasure, of chieftains mysteriously afflicted by supernatural visitants. The sentiments are tribal, not national, and no lesson is taught except that of personal fortitude before the sad exigencies of a hero's life. Compare Roland with his face towards Spain offering his glove to God, and Beowulf dying beside the dragon's hoard and predicting the downfall of the Geats. Such reflections may be a little serious for summer time, but they go far to explain the national differences of the two Powers that have recently struck hands—the highly organized valor of the Frenchman, the more melancholy *Innigkeit* of the Englishman.

To return to the two booklets before us, these prose translations are meritorious additions to the handy series which the Boston house provides for schools and general readers. Miss Butler has caught something of the march of the 'Roland' in her prose, and since any reproduction of the assonantal *laisses* of the original is impossible in English, and any other metrical form a misrepresentation, it is certain that she has chosen the proper medium. In her introduction she tells all that the average reader needs to know about the growth of the Roland legend; an illustration of a page of the unique jongleur's copy of the 'Roland,' and several reproductions from the Bayeux tapestry and other mediæval sources go to complete a very workmanlike little book.

Mr. Child has had a far more difficult task in translating 'Beowulf.' Indeed, every new attempt confirms in your reviewer an old opinion that this poem is untranslatable in modern English. The heavy, oscillatory movement of the alliterative verse is repellent when transferred to prose, and very difficult to suggest in modern alliterative verse. Hall, perhaps, has done it best. But Professor Child has at least had the considerateness to respect his readers, and his version is as free from the jargon that offset sadly Earle's general spiritedness as from the pedantries that make Morris and Wyatt's fairly unreadable. Professor Child's English, which in the main sins on the side of literalness, can be read with some degree of pleasure; but it is terribly matter-of-fact, and certainly emphasizes the author's belief that we must perfect a form of verse which shall rock without halting—in short, the alliterative staves that Garnett, Hall, and others have tried with varying success.

A brief synopsis of the Beowulf question can hardly be made interesting, and Professor Child would have done better to crowd all this preliminary matter into the briefest form, to be digested by readers of the chalkenteric sort, and so give himself elbow-room for a leisurely presentation. Typographical bad luck has befallen the footnote on p. vi.; the Anglo-Saxon specimen on p. xxii. has the half-line pause unduly exaggerated by the spaces, whereas that pause is completely ignored in setting the accompanying metrical translation.

The Memoirs of Rufus Putnam, and Certain Official Papers and Correspondence. Published by the National Society of the Colonial Dames of America in the State of Ohio. Completed and Annotated by Miss Rowena Buell, Marietta, O. Boston: Houghton, Mifflin & Co. 1903. Pp. xxxvi, 460.

The works that have already been published under the authority of the Society of Colonial Dames of America lead us to hope that it may authorize the publication of many more in the future. The present volume is valuable and timely. It gives us the best possible portrait of a man of sterling character whose services to his country have not always been as highly appreciated as they deserve, and it makes accessible much valuable material for the study of the history of the Northwest Territory. It is based on the Putnam manuscripts, the Samuel P. Hildreth manuscripts, and the records of the Ohio Company—all in the possession of Marietta College. The journal which Putnam kept intermittently (it was usually very full only when he was engaged in some military campaign or some engineering expedition), occupies about one-third of the book, while the remainder of the volume is devoted to official papers and correspondence referred to in the journal, or necessary to explain the context. There are eleven illustrations, mainly maps and plans prepared by Putnam himself. The manuscripts have been reproduced exactly, including the "spelling and gramer," the study of which, in Putnam's case, was sadly neglected in his youth—a neglect from which he did, indeed, as he naïvely confesses, "suffer much through life." The editor has limited her part to the insertion of occasional notes of reference or explanation. The index is fairly good, though not as full as could be wished, and the plan is the same as that adopted for the Society's 'Correspondence of the Colonial Governors of Rhode Island.'

Putnam's journal is but little concerned about political events, but treats in minute detail the events of the campaigns or expeditions with which the author was connected. After the first few pages of genealogical material, the part played by Putnam in the French wars is recounted. During the seven years from 1765 to 1772 there is no entry. From 1772 until the outbreak of the Revolution, Putnam was engaged in the West Florida expedition, and on his return we learn nothing about the controversy that was passing into war. Fifty pages take us through the war itself, and about thirty more cover the period of Putnam's activity in the Northwest Territory. These papers are therefore valuable chiefly for the military historian. In the

latter part of the journal, however, there is some useful information in connection with the early history of the Northwest Territory, chiefly with respect to the number and location of particular parties of settlers, relations with the Indians, and the affairs of the Ohio Company.

In spite of "spelling and gramer," the journal makes interesting reading. It is the straightforward expression of a man strong in the elemental virtues of simplicity, honesty, and modesty. Almost the last paragraph is so characteristic of the man and his method that its insertion here may be pardoned. It is in explanation of his dismissal from the office of surveyor-general that Putnam says: "Indeed, I might appeal to my corrispondence with the Secretaries of the Treasury, or even to Mr. Galliten personally, that *no want of ability, integrity,* or *industry* was the cause of my removal from office. *no.* It was don because I did not Subscribe to the Measures of him whom I have called, *Arch* enemy to Washington's Administration. Because I did not die nor resigne" (p. 125). It may be mentioned that his "spelling and gramer" much improves in the course of the journal.

Le Roman Social en Angleterre. Par Louis Cazamian.

Kingsley et Thomas Cooper. Par Louis Cazamian. Paris: Société Nouvelle de Librairie et d'Édition. 1904.

Few people in this country know anything definite about that singular institution, the "Fondation Thiers." Yet the educational project which M. Thiers had at heart and which bears his name, though delayed for nearly twenty years after his death, has been realized since 1893, when the Hôtel du Rond-point Bugeaud was opened for the first five students who were to benefit by the terms of the foundation. M. Thiers was a very busy man, and, like other gifted men who have had little leisure for their favorite studies, or have cherished the conviction that if they had the time they would study, he desired to create an atmosphere in which the minds of a chosen few should be stimulated to produce. He devised the usual stimulus of leisure, the hot-house method which assumes that if you eliminate all possible friction the creative imagination, that delicate plant, will forthwith bloom and thrive. He had no international aims, like Cecil Rhodes; the foundation is strictly reserved to Frenchmen. Every year the five most distinguished graduates in the faculties are chosen by a committee of members of the Institute, are placed in a luxurious and sequestered hotel, are allowed a fair sum for pocket money, and for three years are maintained in learned leisure, about $2,000 annually being devoted to the expenses of each one of the fortunate fifteen. There are no duties, no direction, no limitations; and if leisure were all, the *fine fleur* of the University of Paris would seem to be deprived of all excuse for mute inglorious-ness. Moreover, the "Bibliothèque de la Fondation Thiers" has been established for defraying the expense of the publications that are to be the fruit of this retirement. As a matter of fact, though the foundation was not, we believe, originally intended to smooth the path to the doctorate, the "pensionnaires" seem to devote their three years, or a part of them, to the attainment of the Docteur-ès-lettres.

We have before us two theses for the doctor's degree by a "pensionnaire," both in French—for the University of Paris, not long since resolved not to exact the Latin thesis once indispensable to the highest French degree; the form of two separate dissertations is maintained. 'Le Roman Social' is a volume of 575 pages, to which the second dissertation of 65 pages, 'Kingsley et Thomas Cooper,' is a sort of footnote. In his main dissertation M. Cazamian traces the influence on the political philosophy and legislation of England from 1830 to 1850 of the "novel with a purpose." Dickens, Disraeli, Mrs. Gaskell and Kingsley were the chief writers whose novels contributed to the sentimental reaction against the utilitarian system of Bentham. Of that system Disraeli's 'Coningsby' could say in 1844: "It has passed through the heaven of philosophy like a hailstorm, cold, noisy, sharp, and peppering, and it has melted away." The social remorse of England awoke none too soon. The Chartists had indeed failed, the strikers had failed on every side in those years of cruel indifference to industrial life when the English, having developed a new type of population in their mines and factories, had not yet realized that they must protect it with new laws. But meanwhile the tide of industrial misery rose, labor learned how to organize, and England too might have had her revolution, following on mere riots, in the early forties. But it is the good fortune of England, the practical, that she is always capable of a profound idealistic reaction. Altruism, æsthetic morality, religion, the sympathetic imagination, may for a time be obscured by the spirit of commercialism as they were obscured in the years that bred the Chartists. But in the end the visionary and the humanitarian triumph over the utilitarian and the theorist. The part played by the novels of Dickens in the reaction to intervention is carefully defined by M. Cazamian. Dickens knew little about industrial conditions; the hardships of the lower middle class, the class exposed to the debtor's prison, or the Yorkshire school, claimed his sympathy because he knew them best. Disraeli stands for the aristocratic movement in favor of charitable intervention. In his recent study of Lord Beaconsfield, Mr. Bryce speaks of 'Coningsby' and 'Sybil' as "political manifestoes," but does not discuss Disraeli's position as the foe of the utilitarianism and rationalism of the thirties. Disraeli may not have been wholly sincere when he took the same side as Dickens and Carlyle and faced the same adversaries. But if he lacked sentiment, he did not lack imagination; he saw the danger that threatened England, and when, in 'Sybil,' he wrote with eloquence of the wrongs of the industrial class, he had not forgotten the persecutions of his own race. 'Coningsby,' 'Sybil,' and 'Tancred' are a trilogy devoted to the exposition of the social gospel of the Young England Tory party. The reconciliation of the commercial and landowning classes, the patching up of the quarrel between the factory and the manor, was Disraeli's aim. Like Carlyle, he saw the significance of the industrial revolution. "The age of ruins is past," says a character in 'Coningsby.' "Have you seen Manchester?" The sentimental socialism of Dickens, the social Tory reaction of Disraeli, the Christian socialism of Kingsley, proceeded from very different conceptions of the cure that must be applied to the social conditions of early Victorian England.

The aim of M. Cazamian was to differentiate the motives and the ideals of the Victorian novelists up to 1850, when the cloud lifted. His studies in the economic literature and fiction of his period have been extremely thorough; he is a very accurate writer, and has fully maintained his thesis, which is naturally not new, that the novel with a purpose did more to rouse public opinion and to bring about industrial reforms than all the Parliamentary commissions and Blue Books on the subject. In 'Kingsley et Thomas Cooper' M. Cazamian proves by extracts from Kingsley's correspondence with Cooper the Chartist, and from parallels of Cooper's life with that of the hero of 'Alton Locke,' that Kingsley had Cooper in mind when he drew his Chartist reformer. The point was worth a footnote, but not a dissertation.

The study of English at the Sorbonne and the University of Paris is notoriously inadequate. M. Cazamian can have received little encouragement to pursue his studies in the English novel and the social conditions that produced it. His bibliographies are thorough, and as a whole the dissertation reaches the standard of the better sort of American or German literary thesis, which contributes nothing new, but analyzes and accounts for works whose place is already well defined. It is unfortunate, however, for the prestige of the French degree, or of any higher degree, that it should be bestowed for dissertations which in themselves are no guarantee of severe studies. Evidently, in France as well as in America and in Germany, there is danger that the doctor's degree may degenerate into a mere certificate of two or three years of graduate work, and so become quantitative where it should be qualitative. The work of M. Cazamian should not be dignified with the name "research," for a layman might have produced it. The hard-worked "founder of the French Republic," when he dreamed of the "Fondation Thiers," had in mind, we imagine, a severity of standard, an austerity of scholarly ambition, not to be satisfied with 600 pages of description of the early Victorian novel.

Ruskin in Oxford, and Other Studies. By G. W. Kitchin. E. P. Dutton & Co.

By his many solid contributions to scholarship the Dean of Durham has earned the right to occupy the leisure of his eighth decade with less strenuous tasks. In the above work he offers us, in his own words, "desultory pages" which are merely the work of his "holiday times." This little collection of studies—biographical, historical, literary, theological, and antiquarian—provokes once more the question: Is not the gleaning of the grapes of Ephraim better than the vintage of Abiezer? The Ruskin paper opens attractively at Dean Liddell's dinner table, with Gladstone and Selborne discussing the abolition of the privileges of the gentleman-commoner; a debate in which Gladstone, as might have been expected, took the conservative side. This incident leads naturally to a speculation as to what kind of Ruskin we should have had if the vintner's son had never worn velvet and silk, but had been com-

pelled to hold his own in the common life of his college. Dr. Kitchin went up to Christ Church only five years after the close of Ruskin's Oxford days, and is therefore able, from his own reminiscences, to reconstruct the environment of the time—Gaisford, Osborne Gordon, Buckland (the geologist), Liddell, and Henry Acland, to name the contemporary personal influences only. The author of this volume was still in residence when Ruskin returned as Slade professor in 1869, and again in 1883. There is much good reading in Dr. Kitchin's memories of this period. We learn, for example, how Ruskin hopelessly ruined some of the most exquisitely illuminated of his missals by cutting leaves out of them to serve as illustrations of his points. Another story is of a lecture on "Birds," in the course of which he made the Oxford musicians furious by a digression protesting against the degradation of the psalm, "Oh! for the wings," as he had heard it lately in a college chapel linked to the frivolous prettiness of Mendelssohn's setting. Suddenly, in the midst of his denunciation, he "began to dance and recite, with the strangest flappings of his M.A. gown, and the oddest look on his excited face." Another sample of what was locally called his inspired nonsense was his description of how a hairbrush by incessant rotation evolved itself in the course of æons into a swallow. Dr. Kitchin evidently shares to a great extent Ruskin's depressing judgment as to the mischief wrought by recent changes upon the charm of Oxford. This pessimism is somewhat surprising in one who has seen such excellent results from his own contributions to the liberalizing process—at the Non-Collegiate Delegacy, for example.

The transition is abrupt to the next paper, which describes that disappearing race, the "statesmen," or yeoman farmers, of West Cumberland. Incidentally, Dr. Kitchin makes a keen thrust at a recent exhibition of popular weakness. Quoting from an old account of the dignified thankfulness with which the people of the dales received the news of the battle of Waterloo, he adds the quiet comment: "Men had more ballast then; and it was only Waterloo, not Mafeking." The temptation is great to extract notable stories and reflections from the remaining papers. Their subjects cover a wide ground, including Whitby Abbey, a study of Celtic and Latin Monasticism; Durham College, a glimpse of mediæval Oxford; the Statutes of Durham Cathedral; the North in the Fifteenth Century, an account of the visit of Æneas Sylvius Piccolomini (afterwards Pius II.); a discussion of the reason of Dante's choice of Virgil as his guide in the lower world; an inquiry into the cause of the burial of Slavonian sailors in a Hampshire church; an archæological investigation of the font in Winchester Cathedral, and an address at the unveiling of a memorial to Bishop Butler at Durham. It must suffice to say that in all the diversity of topics there is a unity of interest—the catholic spirit and scholarly taste of the author himself, in whom learning and discretion, literary skill and human sympathy, so delightfully combine.

A Grammar of Oscan and Umbrian, with a Collection of Inscriptions and a Glossary. By Carl Darling Buck. Boston: Ginn & Co. 1904.

It has always been held, and rightly so, that no Latinist, be he professional or amateur, can properly comprehend his own subject without a fairly equivalent understanding of Greek. A quarter of a century ago the additional necessity of a more or less comfortable acquaintance also with Sanskrit was generally insisted upon. The zealous activity of the younger comparative philologists of Germany had communicated itself across the water to America by means of the American students of the classics who had been "made in Germany." Roman history and literature and antiquities had to be studied in a sort of shamefaced way through the lens of phonology and thereafter of syntax. Some enthusiasts went so far as to prescribe liberal doses of Sanskrit for quelling all the ills that were beginning to attack the previously sturdy body of classical education. The dulcet enervation of natural science was to be corrected by the exhilarating stimulus of vrddhi and jihvāmūlīya-spirants.

But the predicted conquests of Sanskrit in the field of general classical education have not been carried out. That language has apparently fallen back from the fighting line. It is now regarded rather as a part of the equipment of the specialist in the purely linguistic field. The principle of comparative study has been welcomed and adopted, but the absurd claim that every Latinist must be a comparative philologist has been properly abandoned. Yet every student of Latin literature must first of all have a thorough acquaintance with the Latin language, even though he may not carry his investigations so far afield as the very cradle of the Aryan race; and upon the Latin language the study of the kindred dialects of ancient Italy often casts a remarkably vivid illumination. Even the schoolboy, who regards as an additional grievance the existence of an antique Latin genitive in -as, and the persistently asserted, but apparently meaningless, identification of a genitive in -ae with a ghostly locative, may find a trifling consolation in the inspection of the regular Oscan forms for these cases; while for the ordinary Latinist the study of Oscan and Umbrian may to great advantage take the place that Sanskrit tried to fill. It is, indeed, only political chance (if it be right to describe as chance the inexorable workings of human character) that has made the world use Latin rather than Oscan.

Up to this time the elaborate and expensive works of Von Planta, and later of Conway, have been the most available means of introduction to the study of Oscan and Umbrian. But what the student needed is precisely what Professor Buck has now furnished him, a thoroughly scientific and at the same time eminently clear and interesting and readable exhibit of the grammar of the two dialects, with constant comparison of Latin forms, and of those to be found in the lesser dialects of the Italic group. The arrangement of the book on the familiar model of a Latin grammar adds much to its practical convenience, and the well-annotated selection of the most important inscriptional remains of the dialects is much better for the elementary student's use than anything that has yet appeared. We should have welcomed, indeed, the printing of the inscriptions in their native alphabets (in so far as the originals appeared thus) instead of merely in transliteration. Oscan and Umbrian stand on a very different basis in this respect from Sanskrit, the individual letters of which number half a hundred, and are so curiously modified and linked together in actual writing. The learning of the Oscan-Umbrian alphabets is, on the other hand, the matter of an hour's application, and adds much to the interest and value of the study of the dialects themselves. The four plates that Mr. Buck gives in facsimile do not afford sufficient practice, and of these the three illustrations on Plate I. are useful only as indicating the shape of the material on which the inscriptions are cut or painted, for the inscriptions themselves are illegible.

The book will be of interest to more than one class of persons besides professed students of philology. The merely curious acquirer of information (and we hope the specialization of the present day has not scoffed him out of existence) will now find it possible in a few hours' time to gain a fair general knowledge of the difference in tongue between the sturdy Samnite and his more fortunate Roman conqueror. The student of Italic antiquities will be tempted to study at first hand the transactions of the Atiedian priesthood, the Iovilae offerings, and the dire Curse of Vibia. The reader of Horace mayhap will be pleased to picture to himself Bantia as something else than a region of forest-glades. Even the prospective, or past, visitor to Pompeii may readily learn to interpret those non-Latin inscriptions that confront him there, of which he could otherwise tell only that they are recorded in a curious angular cryptogram.

The detailed discussion of Mr. Buck's work will naturally find its place in more technical journals; meanwhile we welcome it cordially as one of the most valuable, important, and significant contributions made by American scholarship to the old learning, which is ever new.

Desiderius Erasmus concerning the Aim and Method of Education. By William Harrison Woodward. Cambridge (Eng.): University Press; New York: Macmillan. 1904.

If there was a sincere side to Erasmus of Rotterdam, it was certainly displayed in his attitude toward the subject of education. He refers in many of his writings to this primary condition of a revived and enlarged culture, and devotes to it two special treatises of considerable length. It is, however, lamentably true, as Mr. Woodward remarks in his preface, that the biographers have allowed his services in this direction to be obscured by what they have regarded as his larger interests, notably by all that concerns his relation to the reformation of religion. It is, therefore, a significant service that Mr. Woodward has here rendered by bringing together in this little volume the most important indications he has been able to gather from Erasmus's own writings of his educational aims and methods.

Beginning with a brief sketch of Erasmus's life, the author shows that he has made a careful study of the biographies, and that he is guided by the latest and most critical. He realizes fully that Erasmus's account of his own early years must be

taken with the largest allowances, and estimated, not so much by what the man says directly about himself, as by the obvious implications of facts. He drops entirely the old notion that Erasmus was a victim of monkish persecution, and accepts fully the view that the ten years spent at Steyn were years of fruitful intellectual work and of stimulating companionship. At the same time we are reminded that the habit of mind then acquired may account for many of the restraints and limitations of Erasmus's later life. The characterization of the great humanist given here in a few pages is more discriminating and more just than most of the biographers have given us in their volumes. Nowhere have we seen better expressed than here (p. 35) the essentially unhistorical character of Erasmus's mind. Antiquity was to him "not merely a past"; it was "an ideal to be defended or to be criticised." In his thought of the classic civilization as a something universal that might be applied to modern conditions, a kind of universal solvent by which all these conditions would be set free to fall into their true relations again, he always overlooked the hard fact of nationality. The Middle Ages had gone to pieces on this rock of universalism, and not even Erasmus was great enough to escape from its attraction. Hence, we may believe, his indifference to politics, his horror of national warfare, his neglect of modern languages; and hence also his exclusive emphasis upon classical studies as the essential basis of a liberal education. On the other hand, it is precisely this note of universality that gives elevation and permanent value to Erasmus's educational ideals.

In regard to method, nothing could be further from a "system" than what is here laid down. Education stands, to Erasmus, for the harmonious development of the whole man from the earliest moment of conscious existence—and before. His detailed suggestions are only aids to the carrying out of this central thought. Mr. Woodward emphasizes especially what we are apt to call the "modern" notion of interesting the boy instead of trying to force him by mere compulsion; but it will be observed that Erasmus does not say, "Make the boy study only what he likes," but, "So teach him that he will like what he studies." His ideal of the teacher is almost too lofty. It suggests a man who, like Erasmus himself, would probably cordially hate the drudgery of teaching. So far as we have here principles of instruction, they are based upon plain common sense. Speech comes before reading, and writing follows. The text to be read must be explained in such a way that the boy will comprehend and be interested in what he reads, while at the same time he gains command of the medium through which his thought is to be expressed.

The last third of the volume is taken up by translations from the two most important Erasmian treatises on education: *De ratione studii* and *De pueris statim ac liberaliter instituendis*, together with one chapter from *De conscribendis epistolis* and a selection from the colloquy, *Convivium Religiosum*. These might rather be called paraphrases than translations, since Mr. Woodward has allowed himself large liberties of omission and occasionally of insertion. He justifies this by stating that he does it to avoid "Erasmian redundancy of illustration," but it has the effect of depriving his version of much of the true Erasmian flavor. The scholar can, however, if he will, make his own corrections, following the careful references to the columns of the Leyden edition which accompany each paragraph. The volume as a whole is a welcome addition to the literature of Erasmus which recent years have brought us.

Laws of New Hampshire, Including Public and Private Acts and Resolves and the Royal Commissions and Institutions. With Historical and Descriptive Notes and an Appendix. Edited by Albert Stillman Batcheller. Volume I., Province Period. Manchester, N. H.: The John B. Clarke Co. 1904. Pp. 914.

We have here a volume of State papers prepared in continuance of the policy, begun by New Hampshire in 1867, of collecting and printing documents of various descriptions pertaining to her early history. Some of this material has already appeared in earlier volumes of the New Hampshire State Papers; other papers are transcripts from the English archives. The purpose has been to get together in one collection all the laws and ordinances of the Province Period (1679-1702), and it seems as if this purpose had been accomplished. The volume is bulky enough. Its size proceeds partly from the fact that the editor has conceived it to be his duty to insert many pages of historical memoranda from the writings of Jenness, Tuttle, Hoyt, and other local writers who have discoursed upon the topic of New Hampshire's settlements and of the first years of her existence. The editor has done his work well, though perhaps a little too heavily. Some of the longer notes might have been condensed to advantage.

We are not greatly impressed, however, with Mr. Batcheller's faculty of historical narration. His style is labored and diffuse. He writes as one who is content to follow in the footsteps of historians of an elder day. He accepts the Puritan view without question; and this, too, when the distinctively New Hampshire writers of a later time, after an exhaustive study, have found themselves at variance with Winthrop, Belknap, and Palfry and that school. We have space for but a single illustration. In treating of the genesis of the union between the New Hampshire towns and the Massachusetts Bay Colony, in 1642, the editor observes:

"Despite the fact that the course of the towns in adopting the 'Combinations' showed a creditable respect for law, it was found difficult to preserve order among the people. This is not surprising when we recall that such adventurers as Burdett, Larkham, and Underhill were among their chosen rulers. As the towns were a frontier region, exposed to the hostilities of the French and Indians, whose most active spirits were licentious clergymen exiled from Massachusetts Bay, it was a most natural course to seek a political union, under favorable terms, with the strong contiguous Puritan colony" (Introduction, p. xxx.).

One discovers here no hint that full reliance cannot be put in the charges freely and harshly laid against some of the clergy of that period by the Massachusetts authorities, and gravely believed by Massachusetts writers of history. Nor is there a suggestion that the alleged spontaneity of the movement for a union may possibly be questioned. Nothing is said as to the complaint, entered by some of the inhabitants of the towns, that the Bay people came where they were not wanted.

In a work of this character, officially put forth by the State, it might perhaps be well either to leave out an historical sketch involving facts that are the subject of controversy as not necessary; or else to state briefly the two views entertained by writers on the subject—and there stop. But we are none the less happy to be able to praise Mr. Batcheller for the fidelity with which he has accomplished a formidable task. The print is good; the proof-reading evidently has been scrupulously attended to. There is an index of subjects as well as of names. The enterprise certainly brings credit to the State of New Hampshire. The written laws of a free people reflect much of that people's character; they form an authentic source of history; and this volume is a storehouse of material for the publication of which the student of American history may well feel thankful.

The Evolution of Modern Liberty. By George L. Scherger. Longmans, Green & Co. 1904.

Evolution is so elastic, not to say vague, a term as to apply to almost any view that may be taken of a subject. Were it otherwise, we should be inclined to call the title of this book misleading. We might reasonably expect to find here some account of the development of the principal rights enjoyed by the citizens of modern States, and we certainly should not expect to end our survey with the beginning of the French Revolution. It seems strange, too, to find in a treatise on the evolution of liberty no mention of the protection afforded by the writ of habeas corpus, or of the principles involved in Wilkes's case. Indeed, so far as we have observed, none of the great constitutional decisions of the English judges is so much as mentioned.

What is really done by Prof. Scherger is to give the views of numerous writers, ancient and modern, on the theories or doctrines of natural law and popular sovereignty. It was his original intention to consider the relation between the principles stated by the French Constituent Assembly in the "Declaration of the Rights of Man and of the Citizen," and those expressed in the American bills of rights. On this subject there has been some controversy between Professor Jellinek and M. Boutmy; the former regarding the Declaration as a literal transcript of American statements, the latter maintaining it to be a purely French production, attributable to the influence of Rousseau. The truth, as Prof. Scherger shows, lies between these views. The evidence is abundant that French philosophers and statesmen had been deeply interested in the course of events which culminated in American independence, and were familiar with the "declarations" of American patriots. The debates in the Constituent Assembly on the Declaration of Rights show this familiarity, and Lafayette explicitly maintained that only since the American Revolution had the necessity of defining the fundamental rights of man appeared, and that the example then set should be follow-

ed by France. But, while the formal enunciation of these rights in the American colonies was a conspicuous event, the French statesmen were not ignorant of the sources from which James Otis and Samuel Adams drew their inspiration. Our forefathers were well read in the doctrines of natural law and popular government as set forth by Sidney, Milton, and Locke, and did no more than embody their reasonings in formal declarations. With these reasonings the French statesmen were as well acquainted. They had watched with interest and with envy the successful struggles of the English against the arbitrary powers claimed by their rulers, and they were disposed to follow English rather than American precedents. On this point, the fact that they meant to establish, not a republic, but a constitutional monarchy, seems to be conclusive.

In his examination of the sources from which these political theories were derived, Professor Scherger goes over ground that has often been traversed, although perhaps never more thoroughly. He takes up one writer after another, and gives a summary of his opinions, as if he were writing articles for a dictionary of philosophy. He scarcely attempts to trace the influence of these political theories on positive institutions, unless in the case of the early settlers of New England. A great part of the work is devoted to the doctrine of natural rights; but more is to be learned from the brilliant generalizations of such a writer as Sir Henry Maine than from lists of books in which certain opinions are advanced. We must commend the industry which has epitomized many treatises now almost sunken into oblivion, and which show us how ancient is the justification of "modern liberty." To read such a catalogue, however, is tiresome, and we must describe the treatise as valuable chiefly as a bibliography.

Like numberless other writers, Professor Scherger assures us that individual liberty was not recognized in the ancient state. The more we learn of the institutions of early times, the more clearly we see that the rights of individuals, implied in customs, must always have existed. Nor is evidence lacking that in theory the absolute right of rulers was denied. The "Antigone" of Sophocles contains the whole truth concerning liberty, ancient or modern; the truth that what may be called indifferently the law of God, or natural law, or the supremacy of conscience, or the right of private judgment, is above the power of government. Rulers may be able to excommunicate, to exile, to torture, to put to death subjects who refuse to obey their commands. That is what we mean by the sovereignty of the State. But when men are commanded to do what they think is wrong, the best of them, ancients or moderns, have replied that they must do what they think is right, and governments have usually been wise enough to give a tacit recognition to this principle.

Explicit and formal recognitions have not, perhaps, quite the importance attributed to them by this author; we know what happened after the French Declaration. It is when the principle animates the institutions of a people that liberty is secure. Yet formal statements keep high ideals before a people, and may thus stimulate the love of freedom. However this may be, we must commend the generous feeling displayed by Professor Scherger in his defence of the rights of the individual, as well as the scholarship which has made his research so exhaustive. It is much to be desired that young men should interest themselves in the irrepressible conflict between freedom and authority, and they will find this book not only valuable for historical reference, but also stimulating to the moral sense. The bibliography with which it is supplied is, so far as foreign writers are concerned, particularly full; but it would be improved by references to some English law books and judicial opinions.

The Stock Exchange. By Godefroi D. Ingall and George Withers. London: Edward Arnold; New York: Longmans, Green & Co. 1904.

Here is a perfectly clear and intelligible account of the methods of doing business on the London Stock Exchange, and of the meaning of the technical terms in daily use among its members, some of which from time to time find their way into our newspapers. In two essential features the Stock Exchange business of London differs from that of New York. In the first place the great mass of transactions in London, instead of being cleared and settled the following day, as with us, run on until the next "account." There are two accounts, one about the middle and the other at the end of each month, so that a couple of weeks often elapse between the initiation and the completion of a bargain. In the second place, the London Stock Exchange is composed of two classes of members, the brokers and the jobbers, while with us there is no such distinction. This English differentiation is precisely analogous to their division of the legal fraternity into solicitors and barristers, and in either case it is difficult for the unprejudiced mind to see any advantage in the more complicated system. In London the broker takes orders from his clients, but, instead of buying or selling in the open market, as New York brokers do, he has to go to a jobber, who stands ready to buy at one price or sell at another; these prices being generally from a quarter to a half per cent. apart. It would be difficult to show that the client fares any better under this system than by the American method. On the contrary, inasmuch as the jobber is committed to buy or sell only a very moderate amount of stock at the figures he names, it would appear probable that the open-market plan would result in closer trading, particularly if the amount to be dealt in was considerable.

But, whatever view may be taken of this peculiarity of London dealing, there is scarcely any room for doubt that in regard to the other essential difference the American system is the better and safer one. Very serious fluctuations in prices may and often do occur in a single day, but the resulting losses can be kept within bounds if all transactions are settled within twenty-four hours, and if the margins on all loans are adjusted to the new conditions in the same period; whereas if all transactions and loans are "hung up" for a fortnight, there is an obvious and most undesirable increase of risk to both brokers and money-lenders. Without offering any serious argument in support of their position Messrs. Ingall and Withers take the opposite view, apparently on the ground that daily settlements "tend to make the Wall Street market exceedingly sensitive." A long acquaintance with Wall Street leads us to the conclusion that fortnightly settlements would make that interesting locality even more sensitive than Messrs. Ingall and Withers suppose it to be. But they supply a better argument on another page, where they refer to the "alarming fashion in which one [London] Stock Exchange failure in these days promptly involves two or three other firms." In fact, it is a case where the proof of the pudding is in the eating, and there are certainly more failures on the London than on the New York Exchange.

THOMAS Y. CROWELL & COMPANY

426-428 West Broadway - New York

SCHOOL TRUSTEES,

PRINCIPALS,

TEACHERS,

And others interested, are invited to consider the advantages offered by the *Nation* as an advertising medium. School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed on other pages.

The *Nation*, in its special field of political and literary criticism, is unlike any other periodical, American or foreign. About 10,000 copies are circulated weekly, but these figures do not accurately represent the number of its readers. It is taken by reading clubs and literary associations in a large number of places, and may be found on file in every library of importance in the country. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters.

Advertising rates, 15 cents a line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

THE NATION, 208 Broadway, N. Y.

Teachers who are looking for the best text-books will do well to write to the American Book Company, New York, Cincinnati, Chicago, and Boston, for their complete illustrated descriptive Catalogue of High-School and College Text-Books.

NO. 59 WALL STREET, NEW YORK.

AN EDUCATIONAL DIRECTORY

I.—The NATION stands alone in its field. It has a larger circulation than any other politico-literary journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

II.—The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

III.—The School List in the NATION has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

IV.—The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

PUTNAM'S NEW BOOKS

The Trail of Lewis and Clark

A Story of the Great Exploration across the Continent, 1804-06; with a Description of the Old Trail, Based upon Actual Travel over it, and of the Changes Found a Century Later. By Olin D. Wheeler, member of the Minnesota Historical Society, author of "6000 Miles through Wonderland," etc.

2 vols. 8vo. With colored frontispieces, and about 200 illustrations, including Maps and Diagrams. Net, $6.00. (Carriage, 40c.)

This work is not a mere re-hash of the famous Journal of Lewis and Clark. While the great epic story of this exploration is given, the work contains also a description of the Trail at the present time, and thus are presented, both by pen and by picture, the strong contrasts between the country as seen by the intrepid explorers and the scenes which meet the eye of the traveller of to-day, journeying in safety and comfort. No other work emphasizes the importance of the Louisiana Purchase as fully as does this record of journeys made a century apart.

A Journey in the Seaboard Slave States (1853-1854)

With remarks on th ir Economy. By FREDERICK LAW OLMSTED, author of "Walks and Talks of an American Farmer in New England." With an Introduction by W. P. TRENT.

2 volumes, with portrait, 8vo, *net*, $6.00.

Originally published about fifty years ago, the material collected by Mr. Olmsted is to-day of great interest as a graphic description of the South on the eve of its great catastrophe and possesses continued value and importance because of the light it throws upon the problems connected with slavery.

The Nation.

NEW YORK, THURSDAY, JUNE 23, 1904.

The Week.

For the second time in succession a Republican National Convention meets with the result foregone for months beforehand. That state of things may betoken great harmony and a flattering outlook, but is adverse to vast ebullitions of excitement at the Convention. Only paid *claqueurs* or dutiful and expectant office-holders can work themselves into a frenzy over the rising of the sun on schedule time. A national convention is a body of 900 men ostensibly met for deliberation. A contest is implied in the very fact of their coming together. If all are of one mind, there is no more reason for their meeting, at great expense and inconvenience, to nominate a President, than there was for a convention to nominate George Washington. In addition to the absence of piquant differences over candidates, we have this year the platform also settled in advance down to the smallest details. Lodge has the party principles in his valise. Nothing is left to the Convention except to go through the motions.

As a form of life insurance for President Roosevelt, the nomination of Senator Fairbanks as Vice-President would be intelligible. Certainly, the maddest anarchist would never think of killing Roosevelt to make Fairbanks President. For other grounds for his selection, however, one would search in vain. He is all compact of negative qualities. Without warmth or color of personality, having neither initiative nor eloquence, identified with no public policy, and known only as a rich manipulator of the Indiana Republican machine who never commits himself, and who, instead of dying in the last ditch, would always be found on the first fence, Senator Fairbanks could add nothing to the Republican ticket except a weight to be carried. We presume that the determination to put him on it is due to the belief that his nomination will make Indiana safely Republican. He has some enthusiastic friends in that State who would like to elevate him to the Vice-Presidency in order that they might have the disposal of his seat in the Senate. That, too, is a motive we can understand; but other reasons why Fairbanks should be nominated we are not given. With Roosevelt himself debarred from speaking or touring through the campaign, the cry has been for a running mate who could kick up the dust and snort. But Fairbanks would be as far as possible from that kind of horse. If a complete foil to Roosevelt and a damper on the whole campaign is wanted, the Indiana Senator is just the man to nominate for the Vice-Presidency.

Quay is dead. Long live Addicks! The Republican National Committee hastened on Thursday to console itself for the loss of one corruptionist by welcoming another. Addicks was declared "regular," and went about receiving with bland smiles congratulations as the next Senator from Delaware. That national disgrace is now distinctly on the Republican programme. The term of the anti-Addicks Senator, Mr. Ball, expires next March, and the gasman proposes to buy the Legislature in the November election. But since he also promises to buy Delaware for Roosevelt, the party of moral ideas has not a single objection to raise. "Would not a knighthood fit the crime?" Sir Robert Peel was asked, when a disreputable politician was urged upon him for a baronetcy. The Republican Committee has evidently decided that a Senatorship exactly fits Addicks's electoral crimes.

Shrewd party policy would not have dictated the decision in the Wisconsin case reached by the Republican National Committee. Its action puts Wisconsin in the list of doubtful States. The reasons lie on the surface. Whatever may be said of Gov. La Follette, he is a man of showy and popular qualities who has again and again demonstrated his hold upon the voters of his State. For such a leader to be set aside incontinently and completely by the Committee, although he was technically "regular" and his opponents the bolters, and although the legal merits of the controversy are still to be judicially determined, is certainly to create a very ugly situation. The effect cannot be limited to the State ticket. It is bound to involve the vote for Presidential electors. Resentment is sure to strike through Senator Spooner and reach Roosevelt himself. Spooner is the President's chief apologist. It will be angrily charged, accordingly, that the Committee acted on a Presidential hint in behalf of his friend. This, however, we consider unlikely. Mr. Roosevelt is too clever a politician for that. The case seems to be more like another example of Senatorial courtesy. With two Senators appealing to a Committee on which other Senators are sitting, how could they be turned away? But this explanation will not help matters in Wisconsin. The Governor is already making threats.

The proceedings in the Hearst-ridden Illinois Convention on June 14 were enough to curdle the blood of all sensible Democrats. Here we notoriously have a State in which the Republicans are torn with factions, where the loudest complaints have been made of the Republican machine, and where the opportunity for a rational and decent Democratic party is obviously great—but what was done? A machine and a boss far more offensive than anything the Republicans can produce were enthroned; a set of Socialistic delegates, with an apologist for trades-union boycotting and murder at their head, put through instructions for Hearst, with the net result of throwing Illinois as a gift to the Republicans and sending a chill down the back of Democrats the nation over. There can be but one political effect. Southern delegates will merely shudder, and proceed to concentrate upon Parker more rapidly than before. Uninstructed delegates will find themselves drawn the same way. States putting forward favorite sons will take good heed that, wherever they go after the first ballot, they throw their weight unmistakably against Hearst.

For "the tariff revised by its friends," read, "the tariff revised by its abusers"—such is the suggestion of the Mississippi platform. It is a neat countering of phrase by phrase. Congressman Williams, who devised it, showed his adroitness also in the draft of a money plank. It congratulates the country on the addition of $2,000,000,000 to the world's stock of "real or metallic money, in a manner acceptable to all Democrats," this nation's share of the increase being $700,000,000. This swelling of the volume is held to "vindicate the Democratic contention" that it was necessary. In some such language, it is highly probable, the National Convention at St. Louis will announce the intention of the Democrats to meddle no further with the gold standard. They can save their faces by pointing to the unexpected increase in gold production. Republicans will be in no position to jeer at this. It is the same argument which converted their own militant friends of silver, like Hoar and Lodge and McKinley himself. The country, we believe, will not care very much by what process of reasoning the Democrats convince themselves that the gold standard must be let alone. The main thing is that they do it.

"If the Filipinos become fit for self-government, and desire independence, God knows I want to give it to them." That extract from Secretary Taft's speech on Friday night shows how native to his heart are generous sentiments; but it also shows how hopeless

is his effort to prevent Americans from discussing Philippine independence. He himself cannot refrain from discussing it. If the rest of us are indiscreet and are "rousing false hopes" and "encouraging agitators" in the archipelago, what is he doing? His words will be carried back to the islands, though they are very much of the sort that he has called unwise and incendiary. In fact, an expression like his personal wish is nearly all that the Philippine Independence Committee, whose work is so displeasing to him, is asking of the National Conventions. If both parties would simply echo Secretary Taft's phrase, and call God to witness that they desired to give the Filipinos independence, the prayer of the Committee would be practically granted. It is a petition backed by some 7,000 names of the nation's wisest and best. A copy of it, with the imposing array of signatures, is being placed in the hand of every delegate at Chicago. Can the Republican party, can Mr. Taft, can President Roosevelt afford to despise it?

One passage in Secretary Taft's speech on Friday is either unfair if taken literally, or really ludicrous as a mere rhetorical rejoinder. He asks why the college professors and clergymen, instead of calling for Filipino independence, do not "hold up my hands in trying to induce Congress to reduce the tariff" on Philippine goods. Bless the Secretary's innocent heart, no one has done that precise thing more consistently than the very men to whom he makes his appeal. They have approved and urged every measure in the interest of the Filipinos, when it was not cunningly devised as a means of exploiting them. And who are the ones that have withstood Mr. Taft's pleas, set aside even the President's recommendations, and kept the tariff inflexibly against the Filipinos? Why, the leaders of his own party; the politicians who propose to squeeze every dollar and every office possible out of the Philippine Islands. Secretary Taft means to support them on a "stand-pat" tariff platform, and then expects them to hearken to his prayer for tariff reduction. Impracticable for impracticable, we think he fairly rivals any of his despised anti-Imperialists.

An exhibition of pure selfishness was made by the Grand Army, on Thursday, at the convention of the New York Department. Naturally, an absorbing topic was the President's service pension order of last March—regarding which commendatory resolutions were passed. Then a letter was read from the Allied Printing Trades Council asking the veterans to announce themselves in favor of requiring all printed matter used by the Department to bear the union label. Such a resolution "the delegates did not see fit to adopt." In a word, the fine patriotism of forty years ago has evaporated. The veterans of Gettysburg and the Wilderness no longer ponder the rights of man, but are concerned entirely with getting as much and giving as little of the good things of life as possible. They have put the union label on the taxpayers of the United States, but they have no intention of suffering the infliction of a similar policy by organized labor. Themselves the most imposing labor union in the country, they have gathered their cloak about them and assumed a haughty air towards their brethren the printers.

Chicago unionists have been charged with many crimes, but a new count is brought against them by a New York street-cleaning expert. Invited to Chicago to inaugurate a system that would produce "maximum results at a minimum expense," Richard T. Fox found himself, at the end of the first day, homesick for New York, "where unions aren't so strenuous." He had infused industry in his sweepers, and by evening he saw the street refuse piled neatly beside the curbs. But at that point the City Team-owners' Association stepped in with a demand for more pay than the city allows for the carting. One solitary non-union driver appeared at nine o'clock in the evening and was promptly ordered to "get off the street" if he didn't want his face smashed. Mr. Fox tried to get teams from a number of contractors, but the tie-up was complete. The neatly piled sweepings became sport for the winds. On the previous day, the New York expert had ordered a load of coal for his own cellar, and when he came home found the coal cart standing in front of the house while the driver possessed his soul in patience. When ordered to unload the coal, the strict unionist answered: "Not me. The union won't allow it. I'll spill it on the grass for you if you say so, though." The proper union man was sent for and the coal got in. The dealer only laughed at all protests. In a union-ridden city they have got used to such pretty ways.

The approach of a new harvest is denoted by the appeals now being made for a reduction in railroad rates to farm hands. The Western Passenger Association has just submitted to its various lines a proposition for a one-cent per mile rate for persons going to work in the fields of Kansas, the westbound tickets being good from June 27 to July 10. Thus we are reminded that it will soon be possible to speak more definitely regarding the future course of general business. If the crops turn out well this year, a feeling of encouragement should in large measure take the place of the depressed views which have prevailed for the past year. During the recent setback to general business the farmers have continued to be prosperous. Meanwhile, there has been a complete cessation of most of the causes which led to the comparative stagnation of the last ten months. Much of the inflation has been eliminated from credits, excessive stocks of goods of all kinds have been worked down, and the voice of the promoter and boomer has ceased to be heard in the land. In short, the country has had a year of recuperation, and, if the crops turn out well during the next few months, the feeling with which we approach the winter of 1904 should be in marked contrast with that of 1903.

Of the numerous influences affecting immigration, the cost of transportation is comparatively unimportant. Steerage rates in 1903 were about 50 per cent. higher than in 1880; yet 857,000 were brought over, as against 457,000 in the earlier year. Prosperity in this country always increases immigration, though there are, of course, modifying considerations. The industrial situation in foreign countries is one of them. Political and religious or racial persecution is another; this largely accounts for the enormous Jewish influx of recent years. But there is no doubt that the greatest single cause of immigration is the condition of the American labor market. The 79,000 immigrants of 1837 fell to 38,000 in 1838; the 427,000 of 1854 to 90,000 in 1860; the 438,000 of 1872 to 261,000 in 1874. These figures, and numerous others that might be cited, are explained by the "prepaid ticket"—that is, the steerage ticket purchased on this side and mailed to friends and relatives at home. According to Mr. Schwab, 60 per cent. of all steerage traffic is by such prepaid tickets. A stream of immigrants' letters flows from America to Europe, detailing the new opportunities for labor and the general attractions of American residence. The fact that immigration is declining must, therefore, be regarded as another sign of the lessened demand for labor. Yet the effect of good and bad times upon immigration is not immediate. In our "boom" year of 1899 only about 311,000 newcomers landed. It was not until 1902 that we had reached the 500,000 mark; not until last year that we surpassed the record of 1882. The recession will also be gradual.

With all the recent flurry over reduced steerage rates, the fact is that immigration is decidedly on the ebb. The greatest on record was that of 1903, when 857,046 aliens were admitted. The decline set in last December. In that month the total was only 28,000, against 36,000 the year before. Since then the figures have gone down steadily. The busiest months at Ellis Island are April

and May. Last year in April 91,000 came in; this year 63,000. For May the corresponding figures are 92,000 and 68,000. The total immigration at New York for the fiscal year ending June 30, 1903, was 599,488; the total up to date is 479,286. For the whole country it would seem safe to predict an immigration in 1904 not exceeding 700,000.

Words are too feeble to express the pity and the horror of the *General Slocum* disaster. The character of the victims—women, mostly, and children of tender years—the swiftness of the destruction that has overtaken half a modest parish, the terror of sweeping flames, and of loaded decks collapsing into the furnace below—all these heart-rending features of the tragedy strain the compassion of the mere reader to the point of numbness. The coroner's inquest has already brought out the facts that the examination of life-preservers was perfunctory, that the fire apparatus was not inspected at all, that the second officer had never taken out a mate's license, that no fire drill had been held with the present crew, that the crew itself contained a number of incompetents. Thus, step by step, the responsibility is driven home, on the one hand to the owners of the boat, on the other to the steamboat inspectors. Both, it appears, willingly took desperate chances with the lives entrusted to their vigilance. The owners who manned their boat with the riffraff of the docks and maintained unlicensed officers, assumed that no better class of men would ever be needed, just as the manufacturers who supplied worthless life-preservers figured that they were to be paid for and exhibited in racks—never used in the water. Upon the basis of the evidence already brought out by the coroner, we may expect Secretary Cortelyou and District Attorney Jerome to proceed fearlessly. Already it is clear that we are dealing with a kind of negligence which morally reaches criminality, and it may be legally as well.

Gen. Uhler's hint that the steamboat inspectors' fines have frequently been remitted through political influence ought to be followed up with names and specifications. Such a state of things would go far to explain the complete demoralization of the inspectors. What can a man do when he finds, on the one hand, steamboat owners willing to pay him for leaving his duty undone, and on the other his chiefs ready to make a fool of him for doing his duty? When Gen. Uhler says that Senators and Congressmen have had such fines reduced, he undoubtedly speaks by the book. Clearly, he should continue the subject before the Commission of Inquiry, and Secretary Cortelyou should not fail to carry back to its source the rottenness his department has inherited. At every point he must be prepared to find lying and concealment in behalf of those "higher up." Already Inspector Lundberg, who gave the *General Slocum* clean papers five weeks ago, refuses to answer the coroner's questions, "on the ground that it might tend to incriminate me." Such an attitude shows clearly that it would be absurd merely to order an investigation of the inspection service by itself.

A remarkable delegation of English clergymen waited upon the Archbishop of Canterbury a few days ago, upon a remarkable errand. They sought a change in the rubric requiring the public reading of the Athanasian Creed on certain great festivals of the Christian year. Bishop Welldon was their spokesman, and his remarks, together with the Archbishop's long and careful reply, indicate significantly a theological trend of the day. The appeal was chiefly directed, as may be supposed, at the minatory clauses of the Creed. To rightly appreciate these, affirmed Bishop Welldon, "demanded an historical spirit, a theological learning, which could not be found in congregations consisting of men and women, educated and less educated, and even little children." As much might be said, one would think, of many of the metaphysical parts of that most metaphysical Creed; but as for the damnatory clauses, there can scarcely be two minds. Whatever else they may be fitted for, they do not go well with a religious service meant to be uplifting and joyful. To begin with "without doubt he shall perish everlastingly" and to end with "he cannot be saved," is not a good way to invite tranquil meditation upon the theological doctrines which are affirmed in between. Archbishop Davidson pointed out the difficulties in the way of practical relief, but left it in no doubt where his sympathies lay. He did not attribute the movement to evil hearts of unbelief. To him it was, rather, a gratifying sign of greater intelligence on the part of the Christian commonalty.

Our American theory that prosperity can come only from taxation has received a severe blow in Europe. The theory was applied with all rigor in connection with the beet-sugar industry of the Continent. Year after year the people of Germany, Austria, France, and Belgium were bled to prop up this clamorous infant, but even then it was necessary to combine to regulate prices. Finally, the Brussels Convention decided to abolish the bounties on exports. Though the condition of the sugar industry the world over seemed to make this a wise step, there was nevertheless a fear that it would result in ruin to many of the beet producers. But, wonderful to relate, in Austria the effect appears to have been quite the reverse. The immediate result of the cutting off of the export bounties was a decrease in the tax on sugar, but an increased consumption. This is as true of the other nations as of Austria. From September to April, Germany increased her consumption by 207,000 tons, France 210,000 tons, Belgium 27,000 tons, and Austria 60,000 tons. Who before ever heard of low prices bringing prosperity? And yet it is admitted that the Austrian sugar industry was never better off than at present.

We are far from knowing the whole truth about the stiff fighting at Wafang-ku, but the fact that a Japanese force of 30,000 men has fought its way twenty-five miles north of Port Arthur is significant. It looks like the beginning of a concerted movement, in which Kuroki will later participate, upon Kuropatkin's extreme right. The fact that Oku can spare Nozu with 30,000 men also shows that the force of investment below Kinchow has more than reached the strength reckoned as necessary for the reduction of the fortress. Everything, in short, points to a general forward movement by Kuroki, without waiting for the taking of Port Arthur. Gen. Stakelberg's defeat receives a humorous turn through the naïveté of his dispatch stating that just as he had comfortably enveloped the Japanese right, his own right was turned with an overwhelming force. But the fight itself was a serious business enough. It cost to either side many thousand men, and to the Russians fourteen guns. It is known that Stakelberg has his main force near Kaiping, forty miles above the scene of the engagement of June 15. Kuroki's left, at Siuyen, is about as near.

The raid of the Vladivostok squadron has brought out, in a certain impracticable idealism, the seamy side of Japanese valor. Such incidents as the refusal of troops on transports to surrender to warships, the wholesale preparation of such troops to commit suicide, and the demand that an unsuccessful admiral should take his own life, remind us startlingly of the gulf that lies between ourselves and these Orientals. As for the troops who lay helpless under the guns of the Russian cruisers, their preference for death gratified only a personal punctilio. By surrendering at discretion they could have put the Russian fleet to considerable embarrassment. Clearly the Russians could not have taken them prisoners; indeed, would have been obliged to furnish some means of escape from the sinking transports. Under such circumstances, the Japanese would have been under no parole, the Russians would have been subject to a perilous delay, and a thousand troops would have been spared to fight the battles of the Empire.

THE SPURNED VICE-PRESIDENCY.

The Vice-Presidency has long been without honor, but it has never been so thoroughly spurned as in the past few days. Speaker Cannon's outbursts of indignation and alarm whenever it was proposed to promote him to that dignity eclipse even Mr. Roosevelt's pathetically unsuccessful evasions of four years ago. Mr. Hitt, we believe, was willing to be Vice-President; generally, the office is treated with indifference by the workers and with abhorrence by the eligible candidates. Everybody, apparently, has read and accepts Woodrow Wilson's entertaining characterization of the second magistrate of the nation, in 'Congressional Government': "His position is one of anomalous insignificance and curious uncertainty; . . . his importance consists in the fact that he may cease to be Vice-President."

In view of this general contempt for what has practically been a very important office, it is amusing to read in the Madison Papers that the office of Vice-President, and particularly his right of presiding over the Senate, was regarded with considerable jealousy. In the Constitutional Convention Mr. Gerry of Massachusetts said: "We might as well put the President himself at the head of the Senate." Col. Mason of Virginia suspected a baneful encroachment of the Executive upon the Legislature. Only Roger Sherman of Connecticut perceived that, without the duty of presiding over the Senate, the Vice-President "would be without employment." Evidently, Aaron Burr took no mean view of this function, for, when he bade farewell to the Senate, he acknowledged that he had been perhaps too stern a chairman, but averred that he had done what he had done from a high and impartial sense of duty. A little later, Vice-President George Clinton, withdrawing for a time that a temporary chairman might be elected, declared solemnly that he should make it a point to be present in the chair whenever important business was up.

A modern Vice-President who combined in himself something of Burr's will and Clinton's sense of obligation could probably redeem the office from insignificance. Admit the difficulty of controlling a body upon which you are imposed, of which you are not even a member, and yet imagine also the possibilities that would open before a chairman of Speaker Reed's, Mr. Roosevelt's, or Mr. Cannon's type. The spectacle of a legislative body floundering in obsolete personal prerogatives, deprived of elementary parliamentary organization, powerless even against its own members, is one to stir the ambition of a parliamentary Hercules. There is no doubt, we are convinced, that he could reduce the Augean stables in the north wing of the Capitol to some kind of order. For even the Senate must sooner or later submit to that codification of common sense applied to debate which we call parliamentary law. It is only necessary to hold up the slipshod procedure of the Senate before the public until it becomes too ridiculous to be longer maintained. Here, then, lies an undertaking worthy of the best powers. Mr. Roosevelt, we understand, had been urged to make this task his own. Had he accomplished it successfully he would have had a far better title to reëlection than that established by an assassin's bullet.

What Mr. Roosevelt perhaps might have done, what any strong personality might do under these circumstances, is this: Apply imperturbably the ordinary rules of parliamentary order as the occasion arises. When Senator Morgan, for example, divagates on the Jesuits apropos of the Venezuela blockade, call him to order. Naturally, celestial ire would threaten to consume a chairman who took so sensible a stand; he would be ridiculed in all the moods; his ruling would be unanimously reversed. Very well, let him take that as in the day's work, and call to order the next Senator who wanders hopelessly from the matter in hand; and the next and the next. Unquestionably, there would be terrible wagging of tongues, but it is doubtful if the task in itself is more difficult than that which Speaker Reed accomplished. At the beginning the President of the Senate would be a laughing-stock, then, as he persisted in provoking egregiously bad reversals of right decisions, the laugh would turn on the Senate, and that popular opinion which it has learned to scorn too loftily would begin to work. No body, not even "the most august deliberative body in the world," can afford to appear palpably and constantly wrong. Obviously the Senate, resenting the just control of the officer appointed to preside over it, would be in precisely that untenable position. Given a Vice-President of sufficient tact and toughness, the victory would remain with him.

Surely, the emprise is worthy of any strong man, Republican or Democrat, who finds himself compelled to accept the Vice-Presidency. Success would hardly make the office popular, but it would relieve it of the deplorable disrepute into which it has fallen, while failure would at least save one Vice-President from the dire perfunctoriness to which he was elected and apparently condemned.

SHAW VS. THE HOUSEKEEPER.

"May the good Lord preserve us from another period of cheap living expenses!" was Secretary Shaw's pious exclamation before the Delaware workingmen. As if in direct answer, the Bureau of Statistics reports an increase since last year in the cost of such necessaries as breadstuffs, sugar, coffee, wool, cotton, and petroleum. Of course, the high-flying protectionist has been taught from his cradle not to apologize for high prices, but to glory in them. He looks beyond trifling questions of every-day food and clothes to the monthly figures for steel billets, block tin, and raw copper, which are just now within reach of the humblest. This means, obviously, rising above all petty and belittling considerations. Our spirits are too exalted to care whether our loaf be dear or cheap. A leader in an English free-trade organization visited this country last year when interest in Mr. Chamberlain's propositions was at its highest. Americans in all walks of life whom he met were anxious to hear from him about the progress of the controversy. But he confessed before his departure, "I have not been able to make them understand why Englishmen should be stirred up over a tax on food." "To us," he added, "it is the most vital part of the fiscal system, while you regard it as entirely of secondary importance."

Mr. Shaw expresses this feeling in its baldest form when he declares that the cost of living is virtually a negligible factor in national prosperity. He represents our domestic trade as a great circle, in which the man in the tan pit can afford to pay an extra 50 cents for his shoes because he gets high wages from a tanner, who pays them only because he has pushed up prices a notch or two in his sales to the shoe manufacturer. But the household is one of the places where the Shaw doctrine cannot be applied by any manipulation of the facts. One family does not buy from another, or sell to it, and the doctrine that "it is measurably unimportant what price we pay so long as we pay the price to ourselves," great and inspiring though it is when applied to a broad continent, has no meaning at all in relation to the affairs of five persons living in the same house.

"The Housekeeper under Protection" is the title of an article contributed by Margaret Polson Murray to the current number of the *Contemporary Review*. It recounts one woman's experience in supplying the needs of a household in Canada and in London. Canada's tariff wall is scarcely half as high as ours. Her schedules, according to our protectionists, would spell ruin and destitution on this side of the border. They have not done it in Canada, to be sure; but it is interesting to learn just what they have done, not from the standpoint of the economist or the manuufacturer, but from that of the final consumer. "At the outset," says Mrs. Murray, "I am not sorry to have an opportunity to refute an almost universal impression to the effect that, whatever may be expensive in Canada, at least *living* is cheap. Strange to say, the case is exactly reversed. The Canadian may adopt armorial bearings, sport his crest on his sta-

tionary, and on the harness of his horses, and have as many liveried servants as he may choose, without contributing from these a single dollar to the revenue of the country; while the housewife is charged on almost every item of the endless expenditure which makes up her daily life." Taking articles of the same quality, she finds that a shilling in London goes as far as two and sometimes three in Montreal.

It may be simple enough for Republican logicians to account for steel manufacturers selling steel rails seven dollars less per ton abroad than at home. The average man is affected only indirectly, and his interest is impersonal. Very few of us build railroads; but all of us maintain breakfast tables, and here protection appears in the clearest light. "A well-known Scotch marmalade, sold in London at sixpence per pot, costs tenpence half-penny, and in some places a shilling, in Canada. Canadian apples, by the barrel, are seven shillings cheaper in London than in Montreal. But I come to the climax when I find London people buying their bread made from Canadian flour at twopence three farthings. The same loaf, with the flour at the very door, in Montreal cost fourpence last October, and has since been raised to fourpence halfpenny." In other lines the results are still more striking. "Curtains, rugs, carpets, and linens are incredibly dearer, three or four times the price, and china, crystal, etc., are at least four times the price. A good piano costs about three times the money." We are not immediately concerned with the details of all the differences in prices that prevail in London and Canadian shops. But the facts and their causes come home to the American accustomed—"educated up," if you please—to high prices when he can look at these same protective prices through an outsider's eyes, and ask himself whether, with complete freedom of choice before us, we should ever deliberately have created such a stupendous system of levying on the consumer.

The late Speaker Reed attributed the Republican defeat after the passage of the McKinley bill very largely to the awakened interest of the housekeepers of the country. They see the relations of income and expenditure in their simplest terms. As one lady of our acquaintance put it, "All that I know about the blessings of prosperity comes to me in the shape of much larger monthly bills." This, of course, would seem a very short-sighted view to the brooding and prophetic Shaw. But it exists widely. It had to be taken into account in 1890 and 1892, and Republican managers will reckon ill if they leave it out this year.

TRADE-UNIONS AND THE LAW.

Trade-union dovecotes are still fluttered by the "Taff Vale" decision of the English House of Lords. For some thirty years previously these bodies had found themselves very comfortably situated. They could inflict injury without being liable for damages. They could deprive a workman of all opportunity to earn a living; they could prevent an employer from carrying on his business. Their funds were exempt from levy. But this pleasant immunity has been suddenly disturbed. The Amalgamated Society of Railway Servants has been compelled to pay the Taff Vale Railway Company £23,000. The South Wales Miners' Federation has been mulcted in £45,000; and the amount claimed by the Denaby Main Company is even larger.

These judgments, it is asserted by the supporters of the unions' position, will bring about a political revolution in England. "Labor," says Sir Charles Dilke, "has been welded together on a labor question; an overwhelming class consciousness has been created among trade-unionists." It is time for them to act as a political party. They have been contented hitherto to force the existing parties to grant their demands, but they are now thinking of becoming legislators themselves. They propose to enact laws that will make the position of the unions impregnable. They mean to secure the privilege of interfering with other people's business without suffering interference with their own.

The privileges to be enjoyed are outlined in a bill drafted by the Trade Union Congress Parliamentary Committee, which has passed its second reading in the House of Commons by a majority of 39. Any person or persons, according to the provisions of this bill, "in contemplation of or during the continuance of any trade dispute," may lawfully "attend for any of the following purposes at or near a house or place where a person resides or works, or carries on his business, or happens to be (1) for the purpose of peacefully obtaining or communicating information; (2) for the purpose of peacefully persuading any person to work or abstain from working."

This provision would compel employers to allow their premises to be occupied by any number of unionists who chose to "attend" there. They could remain so long as they pleased, and "communicate information" all day long to workmen who ought to be busy, and who would frequently much prefer to be let alone. Workmen could be exempted from attentions of this kind neither at their homes nor while going to work, nor at the shop. The essential purpose, of course, is to legalize the presence of a throng of strikers at places where they can practically compel submission to their demands. The circumstance that they profess a peaceful purpose is immaterial; there can be no peace under such conditions, be it cried never so loud. Employers could not prevent the interruption of their business or protect their workmen against violence. The non-union workman would be safe nowhere except in jail.

The second clause of this bill does away with the law of conspiracy. It provides that no agreement by two or more persons to do anything in connection with a trade dispute shall be actionable unless what is to be done would be actionable if done by a single person. It is unnecessary to dwell upon the consequences of this change in the law. Many acts are harmless when committed by a single person, but dangerous when several combine to do them. The aim of combination is to accomplish what the individual cannot; the act, to effect its purpose, must be committed by many. The object of the law against conspiracy is to prevent the concentration of powers for an evil end; and the object of the bill is to allow trade-unionists to conspire without fear of the penalties inflicted on other citizens for like conduct.

The third clause of the bill is meant to relieve unions from the payment of damages, either for torts or breaches of contract. It takes away all right of action against a trade union "for the recovery of damage sustained by any person or persons by reason of the action of a member or members of such trade union." The admirers of trade unions make much of "collective bargaining"; they insist that employers should enter into agreements with the unions of their workmen. This bill make such bargains impracticable. It is absurd to enter into a bargain with a man who tells you in advance that if he decides to break his word, you cannot sue him. Civilization consists in the establishment of laws and courts that compel men to discharge their obligations or pay compensation for their failure to do so. The bill that has passed its second reading in the House of Commons would restore the conditions of the Middle Ages. It would create a privileged class, above the law and free from its penalties. Such a measure would reduce workmen not belonging to the guilds to the position of helots or serfs. They would have to be content with such work as the trade unions allowed them to take, at such wages as they could get in occupations that the unions did not care to monopolize.

It is well for the people of this country to see what the claims of the trade unions really are. In order to attain their end, they must extinguish the competition of outside workmen. They cannot do this so long as the law protects such workmen. At present the law does extend some protection. A workman and an employer wishing to make a bargain against the desires of a trade union have, theoretically, a perfect right to do so. But, in fact, both employer and workmen often go in fear of their lives

if they attempt to exercise this right. It is taken as a matter of course that, in case of a strike, violence should prevail to a certain extent. When a union of workmen on a street railroad quarrels with the management, the company expects to have a certain number of its cars demolished, and to receive no indemnity. Some of the men that want to work will be killed, many of them will be beaten, and they or their families must suffer without redress. It is idle for the trade unionists to profess to deplore these conditions. If they did not exist, if the law gave protection in fact which it gives in theory to employers and workmen, strikes would very seldom succeed, and the monopolies of the unions would be broken. The interest of the common people of this country lies in the suppression of violence, not in legislation that will promote it.

A LABOR GOVERNMENT.

Recent events have invested Australian politics with world-wide interest. The Premiership has passed from one of whom it has been said: "In eloquence he has no equal in the Commonwealth. He is cultured and urbane to an extent unusual in Australian politics. He has the charm of manner and the gift of friends that help to make the leader." His place has been taken by a man who, at fourteen, was an apprentice in a small New Zealand newspaper office, and who, on being launched at a later period into the larger world of Sydney, came to the front with remarkable speed as the leader of the trade unionists. Not only does Mr. Watson, the new Premier, belong to the Labor party, but all his colleagues in the Ministry, with the exception of the Attorney-General, are of the same faith. The situation, in fact, is identical with what it would be in Great Britain if Mr. Balfour were to give place to Mr. Richard Bell, with John Burns looking after the War Department and the other offices in the hands of labor representatives.

The world has waked to the fact that an experiment of vast importance is now under way in Australia. Practically every member of the new Government is destitute of training in administrative affairs, and people are asking if anything but harm can be expected from the efforts of a ministry thoroughly impregnated with the doctrines of the most advance school of trades unionism. Heretofore, the other nations have looked on with good-natured indifference, or at the best with but here and there a lively interest, while Australasia has introduced one seemingly fantastic policy after another. The labor element has for a long time made its presence felt in the politics of the Island Continent, wresting one concession after another from the established parties, but until recently its part has been chiefly that of an influence. Now it is being weighed in the balance as a direct factor in administering the government.

An article in the June *Independent Review* on "The Australian Labor Ministry" is from the pen of Mr. W. P. Reeves, the London agent of the colony of New Zealand. He, though largely responsible for the New Zealand labor laws, is nevertheless the fairest of advocates, and one of the best informed men whom Australasia has produced. Mr. Reeves has no fears on the score of the new Labor Ministry. He says that a dozen years ago the coming of labor in that quarter of the world would have been greeted with vastly more alarm than at this time. It is only fair to point out, he continues, that, though the former contempt for Australian labor politicians was not wholly justified, the politicians themselves have risen above the level on which they then stood. They never were, as a class, incendiaries. But they were, politically, uneducated, and therefore impatient, and unused to weigh the possible effects of exaggerated language. To-day it is very different. The labor leaders are "neither revolutionary prophets nor rowdy agitators," but just such men as the handful of quiet labor members "whose personal merit saves them from being lost in the wilderness of broadcloth in the House of Commons." Personally, says Mr. Reeves, Mr. Watson and his lieutenants are not pick-and-shovel men. They are all workmen raised by their industry and intelligence above the rank and file who work with their hands. Happily, he adds, the Australian Labor Ministers are examples of workers who prefer to lead their old comrades rather than push their own way to placid respectability among the *petite bourgeoisie*.

Of Mr. Watson in particular it is said: "He is as unlike the coarse, howling rough of anti-Labor cartoons as Mr. Parnell was unlike the typical Hibernian blatherskite." He is described as cool, pleasant-mannered, self-controlled, with some knowledge of books as well as of men, and with what his opponents term a "talent for intrigue"—in other words, managing power. He is by no means the most fluent or rousing speaker of his party; but, in the colonies, though the best talkers occasionally gain Premierships they seldom hold them long. It was not oratory, says Mr. Reeves, which enabled Sir John Forrest to govern West Australia for ten years, or which made Sir Edmund Barton the Commonwealth's first Prime Minister; which gave Mr. Kingston and Sir George Turner unprecedented terms of office, or which has kept Mr. Seddon in power in New Zealand for more than thirteen years. Force of character, hearty geniality, and managing skill are described as the qualities which the colonial democracy hold in highest esteem. Without brilliancy or dash, Mr. Watson has impressed those who know him as having the power of digesting plans and suggestions, of "brooding over ideas," and of acting to some purpose, usually at the right time. As we have previously stated, the policy of the new government as enunciated on May 18 contained no features which should alarm the Australian public. Not only Mr. Watson's spoken word, but also his record and that of his party, point to a régime of financial economy. Labor, asserts Mr. Reeves, is pledged distinctly to resist all Federal borrowing, except for conversion. Taking his policy as a whole, Mr. Watson seems disposed to go slow. But, whatever his course, it will not be possible for him to go farther than the Deakin and Reid parties care to have him, as, united, those factions greatly outnumber the Labor members.

A FRENCH BELLAMY.

The French are a logical people; they lack that native fund of stupidity which, to Bagehot's way of thinking, has been the salvation of the Anglo-Saxon, and as a consequence the tendencies of the age always stand out among them in clear and warning relief. Perhaps the most striking instance in recent years of this surrender to a merciless logic is the action of those two great critics and men of letters, M. Ferdinand Brunetière and M. Anatole France, who have practically abandoned their earlier literary antagonism in a newly assumed political hostility. From acceptance of the most rigid of the classical rules in literature, Brunetière has passed into a complete reactionary, whose only watchword is authority and whose one ideal is the religion and the state of the seventeenth century. Anatole France, as a critic, denied the validity of any rules, revelled in impressionism of the most extreme sort, and avowed himself a skeptic in everything. His single aim was to gather up and enjoy the sensations of the hour. Now, by a metamorphosis common enough in Paris, he leaves literature, properly speaking, for politics. It was only a little while ago he laid aside his aversion for Zola in order to pronounce a funeral oration over the champion of Dreyfus. More recently he has been publishing serially in Jaurès's new socialistic journal, *L'Humanité*, a curious piece of fiction, "Sur la Pierre Blanche," in the form of philosophical dialogues.

The theme of these dialogues is significant enough to repay a little attention. Several Parisian friends meet together in the cabin of Giacomo Boni, director of the excavations in the Roman Forum. One of them reads an imaginary dialogue between Gallio and certain of his companions at Corinth, who discuss together the future of the Roman world. In the midst of their conversation Gallio is called away to hear

that dispute between Paul and the ruler of the Jewish synagogue which is recorded briefly in the Book of Acts, and which Gallio dismissed so contemptuously as a contest over "words and names." To these Romans, skilled in the law and philosophy of the day, the stirring of the new religion comes as the vague echo of a street brawl. What had they to do with the religion of an obscure Nazarene? As one of the listeners to the reading says:

"We have just heard a Greek philosopher and several cultured Romans talking together over the future destiny of their country, of humanity, of the world, seeking the name of the power that should succeed Jupiter. While they give themselves up to this anxious questioning, the apostle of the new god appears before them and they despise him."

Then comes the moral of the tale. These learned and inquisitive Frenchmen turn from listening to this dialogue of ancient Corinth to a discussion of the future of their own world, and M. France would seem to accuse them of the same folly as that which blinded the companions of Gallio. Even to-day a new religion is forming under their very eyes, and they ridicule it as a light thing and contemn it as the work of base and self-seeking men. And what is this new religion? Nothing less than Socialism. In a dream recounted by one of the friends, the author presents a picture of society in the year 220 of the Federation of the Peoples, or, in more familiar language, the year 2240 A.D. It is a little disconcerting to find so subtle an artist as Anatole France falling into this cheapest of literary devices, nor can it be said that he displays any particular originality in the details of his picture. He does not even avoid that inevitable dryness and dreariness which fall upon all except Plato who attempt to reconstruct society.

But that is not the point. Whether Anatole France has succeeded artistically where Bellamy and a host of others have failed is a matter of little importance. We are concerned rather with the very fact that a man of so refined and sensitive an intellect should attempt such a work at all. Is there any real justice in this parallel between that old Roman world and society to-day, between the stealthy growth and final victory of Christianity then and the spread of modern Socialism? Is there growing up among the oppressed and otherwise hopeless to-day a new religion destined to take the place of Christianity just as Christianity supplanted paganism, and is the god Humanity to thrust the Christian God from His seat as He cast out Jupiter? The question presented so graphically by Anatole France may well cause a shiver of doubt to pass through the minds of those who slumber in easy acquiescence. Yet, in another sense, the very character of the man who offers the parallel may carry the suggestion of an answer. This rumor of a new religion of Humanity which has caught up in itself the remnants of Rousseauism and Positivism and a multitude of other *isms* comes rightly from the mouth of one who has wandered helplessly in the morass of literary impressionism. In its crude form (and only in its crude form can humanitarianism assume this authority of a religion) it is the mere negation of any ideal beyond the poor scope of daily needs and material desires; it is the product of despairing skepticism, and is predestined to eclipse. There is still room, we believe, for the idealizing intelligence and the guiding will in that safe realm which lies between the impressionism of M. France, following the blind sentiment of the hour, and the rigidity of M. Brunetière, petrified in a stationary past.

HANDICRAFT IN MASSACHUSETTS.

The arts and crafts movement has acquired greater momentum in Massachusetts, so some of the craftsmen say who have had opportunity to make comparison while serving on juries for the St. Louis Exposition, than in any other section of the United States. The special exhibit sent from Boston to the Exposition was, according to common report, unsurpassed even by that gathered in New York city. A Massachusetts man, Mr. Frederic Allen Whiting, was chosen director of the department of applied arts at the Exposition. Only those, in fact, who have followed closely the beginnings and development of the numerous handicraft societies in various communities throughout Massachusetts can have any conception of the enthusiasm with which the leaders of the movement have entered upon their work. On various hands you will hear it asserted that the industrial salvation of New England lies in the reëstablishment of ancient handicrafts. It's all very well, say these enthusiasts, to talk of reciprocity and of what cheaper raw material will do for New England. As a matter of fact, the hope of the section lies in the growth of a public demand for handmade articles of various kinds—a demand that is destined to limit the dominance of the machine everywhere. They believe that Massachusetts and New England generally offer such opportunities as probably no other district of the United States can offer for the development of small hand industries, particularly in the rural neighborhoods where until lately there has been a marked decadence. In handicraft production the question of the price of raw materials enters only very slightly into the cost; the skill and contentment of the toiler in his work are the main factors. The environment in many parts of New England, and especially in those adjacent to the great cities of New York and Boston, is singularly favorable to the art worker, combining country conditions of living with ease of access to great museums, libraries, and other collections. Massachusetts in particular has long been one of the leaders in the field of public-school and normal art education. Young people, furthermore, in great numbers have been drawn to the schools of professional art in New York. As a result, almost every town in Massachusetts contains a considerable number of persons who have had more or less instruction in drawing and painting and kindred arts, but who are usually unable, from the intensity of the competition, to make a living from the precarious professions of painting and sculpture. These people are turning with ever-increasing enthusiasm to the arts and crafts.

Boston is the centre of this handicraft movement, although some of the best-known societies are in the western part of the State and hence more or less within the sphere of influence of the New York art world—such, for example, as the one at Deerfield, started by Mrs. Madeleine Yale Wynne, and the Rev. E. P. Pressy's communistic community at New Clairveaux. Greenfield, Springfield, and other places in the Connecticut valley are interested in the movement, but by far the largest number of crafts workers is now to be found in the towns that cluster about the New England capital. Here, serving to some extent as the clearing-house of the whole movement, is the Boston Society of Arts and Crafts, under the presidency of Prof. H. Langford Warren of the Department of Architecture at Harvard University. It has a membership running far into the hundreds of active workers in all sorts of crafts. The show rooms of the Society, in the quaint old building of the Twentieth Century Club at No. 14 Somerset Street, have steadily become more attractive during the past three or four years with exhibits of basketry and book-binding; potteries, textiles, and glass; metalwork and wood-carving. It is understood from the President's annual report that the Society is in a very fair way financially. At the start it was more or less dependent upon the munificence of well-to-do art amateurs of Boston. To-day it is almost self-supporting, and bids fair very shortly to become entirely so. It maintains amongst its other ventures a little handicraft shop, situated in the same street, in which a group of metal workers is engaged in gold-beating, silversmithing, enamelling, and similar crafts. It is interesting to note that several of the craftsmen in this shop are Finns. Indeed, running over the list of the members in the Boston Society, one finds non-Anglo-Saxon names appearing very plentifully, justifying, perhaps, the contention which has often been urged, that the fine arts in this country will flourish in the future very largely as a result of the influx of more artistic races than that

which originally populated this continent.

Other arts and crafts societies have been started in several of the towns about Boston. Thus, at Hingham, on the south shore of Boston harbor, a place where formerly the manufacturing of buckets and shooks for the benefit of the rum and molasses trade went on briskly, a group of workers has revived a number of old industries and started new ones. The annual exhibition of the Hingham Society, which is held in August, has become, in fact, in quantity and variety, perhaps the best art show of its kind in the United States. The Hingham-made articles all bear the familiar "bucket" monogram. The handicrafts of the Hingham Society consist at present of the dyeing of basket materials and fabrics, basket making and rug making, embroidery and netting, spinning and weaving, beadwork and cabinet work, and the making of candles from the wax of the bayberry—in other words, reproducing the old "bayberry dips" with which Pilgrims and Puritans lighted their houses in colonial days.

Similarly at Malden a very enthusiastic crafts society has grown up, organized by Mrs. Sylvester Baxter. Here an attempt is being made to promote the manufacture of drawn rugs of artistic design and good color; of handweaving in various media; of pewter work, and several other crafts. About eighty members, all actual workers, have been enrolled. Furthermore, Dorchester, Dedham, Hyde Park, Concord, and other towns have all developed their local handicraft industries. Winchester, the home of a number of artists and art workers, has Hermann Dudley Murphy's picture-frame shop, where the hand-made picture-frame, designed to accord strictly with the character of the artist's composition, is produced. A little further away are the Merrimac pottery and other industries at Newburyport, conducted under the direction of Mr. and Mrs. Nickerson, and the various crafts at Ipswich, largely started through the inspiration of the summer classes of Mr. Arthur Dow of New York, and now carried on all the year round. In the centre of the State several enthusiastic handicraft workers have recently organized a society at Fitchburg under the management of Mr. A. G. Randall, with a membership that takes in the neighboring towns of Gardner, where Mr. Arthur J. Stone's silversmith shop has already become famous; Leominster, the scene of Mr. Walley's experiments in pottery; and several other towns. These and kindred undertakings attest the rapid spread of the handicraft movement throughout the State.

Nearly all the arts and crafts leaders seem to believe that the next step is to secure some kind of State coöperation. A distinct movement in that direction was recently made at a conference of the village-improvement societies of Massachusetts, held in Boston. Just what sort of coöperation will be brought about, nobody knows, but something is likely to be accomplished. The Boston Society of Arts and Crafts, it is understood, has generally been unfavorable to association with the other handicraft leagues of the State, for fear that the high standard of artistic craftsmanship for which it has always stood, may be lowered. Elsewhere, however, the feeling appears to be general that the quality of workmanship is being raised rapidly everywhere, and that, with proper assurance of intelligent supervision of exhibitions and salesrooms, the objections to combination will be removed. Only by coöperation, in the matter of output, the president of one of the local societies maintained in a recent address, can the movement be protected from a somewhat disagreeable commercialism that has afflicted it in Massachusetts and in other States. He called attention to the fact that certain dealers, taking advantage of the present fad for arts-and-crafts furniture and other articles, are already putting on the market objects of which the parts may indeed have been assembled by hand, but which in design and spirit are utterly out of harmony with the principles enunciated by William Morris and the other leaders of the art-and-crafts revival in England. As a corrective, he entered a plea for enlisting the sympathy of as many intelligent amateurs as possible in the movement, enrolling them as members of the State societies, giving them opportunities to serve on juries at exhibitions, to be elected to presidencies and other honorary offices, and generally to give the benefit of their enthusiasm and advice. The value of the amateur has been strikingly illustrated in the success of the Copley Society of Boston, which is not a mere association of log-rolling professional artists, but one of professionals and well-to-do amateurs. This official expressed the belief that only in case a considerable body of amateurs can be induced to give disinterested service to what they regard as a cause, will the arts-and-crafts movement gain that momentum which it theoretically ought to acquire. There is, as everybody knows, a very large number of well-to-do people in Massachusetts; by enlisting their coöperation a great deal can be done to protect the workers from the dangers of commercialism.

QUERIES ABOUT RADIUM.

A critical estimate of our present knowledge of radium leads Professor Clemens Winkler (perhaps the foremost chemist of Germany), in the May bulletin of the German Chemical Society, to the conclusion that the evidence of its existence as a distinct element is altogether insufficient. The facts and arguments in point are simple. Radium was found in the mineral pitchblende. This mineral contains, among other things, a small amount of the element barium. The barium obtained from pitchblende is strongly radio-active; barium from any other source is dead. The discoverers of this fact, M. and Mme. Curie, concluded that pitchblende-barium must contain minute amounts of a new, powerfully radio-active element. Although not even the spectroscope, in spite of its wonderful sensitiveness, could reveal the presence of anything foreign, they undertook to isolate the suspected element by a process of fractional subdivision; that is, they dissolved their active barium (in the form of its salt called barium chloride) in a quantity of hot water just sufficient to absorb it entirely, and then allowed the solution to cool. Cold water cannot hold in solution so much barium chloride as hot water; therefore, on cooling, part of the salt crystallized out, and thus the salt was divided into two fractions —one in the crystalline state, the other remaining dissolved in the cold water.

From experience in similar cases it might have been expected that the mysterious radio-active constituent would distribute itself unequally between the two fractions. As a matter of fact, the fraction that had crystallized out was about five times as radio-active as that remaining dissolved. The former was, by the same method, divided into two smaller fractions, and one of these was found to be again about five times as radio-active as the other. By a great many such crystallizations, M. and Mme. Curie finally obtained a minute remainder that showed spectroscopic characteristics belonging to neither barium nor any other previously known element.

Hitherto the radio-activity had been the only hint of the existence of a new element. Now the spectroscope added a second proof. The new element was christened "radium," and Mme. Curie undertook to supply a third proof of its distinctive character by determining its "atomic weight," *i. e.*, the weight necessary and sufficient to saturate chemically certain weights of other elements. The atomic weight of radium was found to be 225; that of barium is only 137. The atomic weight of an element, which is determined by delicate methods of analysis, is its fundamental chemical characteristic. Here, therefore, was a third peculiarity—and a very important one—in which radium differed from any known element. But, strangely enough, in every other respect it was absolutely identical with barium.

Let us now examine in succession the three proofs. First, the radio-activity of a substance and its concentration in certain portions during fractional subdivision do not prove the presence of a new element. This is conclusively shown by many facts like the following. About

four years ago Mme. Curie added to a perfectly inactive salt called bismuth nitrate a trace of radium, and then carefully removed it again. She found that the bismuth nitrate had thus become radio-active itself. She then subjected this active nitrate to a process of fractional subdivision, and found that the radio-activity gradually accumulated in certain fractions—precisely as in the case of the active barium from pitchblende. To-day, after the lapse of nearly four years, one of those fractions is still as active as in the beginning. Yet Mme. Curie had not only eliminated all the radium originally added, but by a special method demonstrated its complete absence.

Can the spectroscope alone prove beyond doubt the essentially distinct character of a given substance? Numerous facts show that the spectrum of a substance depends, not only upon its essential nature, *i. e.*, the nature of its atoms, but also upon a variety of conditions having nothing to do with its nature. For instance, the element oxygen has, not a single characteristic oxygen spectrum, but many different spectra. Such facts diminish greatly the weight of spectroscopic evidence, even if determinations are made under seemingly the same conditions. And so, when the question is asked whether radium is a distinct chemical element, the fact that it has a spectrum of its own cannot be taken as a conclusive answer; especially since different investigators, using different methods, have found radium spectra that have very little in common. Professor Winkler also gives an instance from history, showing how easy it is to draw erroneous inferences from spectroscopic evidence.

Passing to the third and last proof that radium is a new element, viz., its atomic weight, 225, different from that of any other element, one is at first inclined to accept it as decisive. The proof even seems to gain further strength from the fact that the so-called "periodic law" long ago permitted of foreseeing the discovery of an element of atomic weight 225, or thereabouts, and similar forecasts on the basis of that law have been brilliantly confirmed in several cases in the past. But, on the other hand, that same highly constant law also decrees that the element of atomic weight 225 must be approximately as different in all its properties from barium as barium itself is from calcium. Yet such is very far from being the case with radium, which, so far as known at present, is radically identical with barium in all properties except those under discussion. Professor Winkler speaks only of the atomic weight itself. Without explicitly doubting Mme. Curie's determinations, he mentions laconically a recent case in which a slight analytical error led another investigator to the assumption of a very false atomic weight. And Mme. Curie worked under the disadvantage of having but a small amount of radium to experiment upon.

Of course, all this is far from showing that radium is chemically nothing but common barium. But it does show that much further research is required before mankind, struggling with the perverse elements that be, will believe that radium, too, is an independent chemical entity. Meanwhile, we may all share with Professor Winkler his "scientific doubt," and sophomore athletes may rejoice that a new chapter of chemistry is not yet in shape to be added to the troubles of the coming year.

"SHAKUNTALĀ" AT SMITH COLLEGE.

NORTHAMPTON, June 20, 1904.

After nine years of William Shakspere, Smith College has turned to him who has been called the Shakspere of India, and on June 17 and 18 the Senior Dramatic Club gave a presentation of Kālidāsa's "Shakuntalā," the acknowledged masterpiece of the Hindu drama. It is pleasant to say at the outset that the production is worthy of commendation in many ways. Evidence of hard work on the part of the students was visible from the invocation to the end of the last act, during three hours and a half of sustained effort. It was thorough, conscientious work, which showed itself in many details liable to escape notice, in the studied stride befitting the male characters, in the carefully trained-down voices, which scarcely betrayed the femininity of the same difficult parts, and in the perfect smoothness of the acting, which even at the first presentation showed no hitch or hesitancy. A double meed of praise is perhaps due to those who were content to act well parts which were the last one could imagine to be acceptable to a girl actor, such as those of the negro mute and the unkempt fisherman. Further, the effect of the whole was certainly beautiful. The robes and stage setting, however incongruous at times, were artistic; and, to those who did not demand too minute a regard for Oriental propriety, eminently pleasing. The same may be said of the music, especially composed for the play by Professor Coerne of Smith College. It had Oriental suggestions, although it did not attempt to reproduce the airs appropriate to the lyrical parts of the drama. The presentation must first be accepted for what it professed to be, not a rendition of "Shakuntalā" as it was once rendered in India, but as an effort to present the typical features of the play under the limitations imposed by the conditions.

That these limitations were so great as to forbid a satisfactory rendition, it is too much to say. The "Shakuntalā" of Smith College gave much satisfaction. At the same time it must be said that any such attempt as this is so daring as to be predestined to give less satisfaction than an English or even a Greek drama. In the latter one has, if not the Greek music, at least the music of the Greek, whereas in "Shakuntalā" an English version of varying elegance and correctness represented the exquisite metres of the original. The length of a Sanskrit play required pruning and compression, but the Smith College version, by what can be described only as an unfortunate contradiction, was not only compressed, but unnecessarily expanded; the scene of the sage's curse being worked up for effect which, to be frank, failed because of its inherent impossibility. It is difficult enough to give the Hindu atmosphere even with strict adherence to the Hindu text; to invent is to seek danger without compensation. Another unfortunate and unnecessary failure was the whole conception of the jester, who was so Americanized as to be almost unrecognizable. This was, of course, the general fault to be expected, and it speaks well for the acting of the students that they were able to convey any Oriental effect when hampered by American scenery, American clothes, and American music. Some finer points of the original were naturally lost, sometimes by exaggeration, sometimes by a failure to appreciate. But how could it be otherwise with a text that only rudely represented the original, with actors whose ideas of India were furnished by the text, and with music which, however excellent, was not Indian? The Smith College Dramatic Association may be congratulated on having given a real pleasure to many who, by means of this representation, have learned in some measure how pretty a comedy "Shakuntalā" must have been when given in India fifteen hundred years ago. They may also rest in the assurance that the parts of Shakuntalā and Dushyanta, the heroine and hero, came close to the original conception, and that, had these two spoken and sung as they did in India, the effect would have been that intended by Kālidāsa. The dance of the maidens in the fourth act was perhaps the prettiest single scene, as well as recognizably Oriental.

On the whole, the comedy was a source of genuine delight to a large audience, and really taught them something of India. It was also a beautiful thing to see, and perhaps minuter criticism may seem only invidious, for the performance was given for the general public, and that the general public appreciated it was evident not only in the applause, but in the less formal acknowledgement of pleasure to be heard on every hand.

THEBAN LIFE AND ART IN THE LIGHT OF RECENT DISCOVERIES.

CAIRO, April 26, 1904.

Excavators are still busy probing the sandy slopes and limestone cliffs of the ancient necropolis of Thebes, and this wonderful mine, unpromising as it appears at the surface, is by no means exhausted. Several new tombs have been recently opened in the Shêkh Abd el-Kurna group, and on the 30th of March I saw eight camels, laden with the spoils from the neighboring Tombs of the Queens, file past the colossi of Memnon in solemn procession, on their way to the western margin of the river.

When a foreigner is duly authorized to dig in Egyptian soil, he is assigned a definite field, pitches his tent, and hires the native Arabs to do the work. Unfortunately, the contract is often made through their village shêkh, who is the modern slave-

driver in Egypt. The Ghizeh Museum, now in Cairo, is entitled to select from among the movable objects found any which it desires to the amount of one-half of the total number discovered. In this way the great expense of exploration is shared by English lords and American millionaires, while public museums in both England and America are enriched with original documents from one of the oldest and most interesting civilizations. This common-sense policy, which characterizes the rule of Lord Cromer in Egypt, is in striking contrast to the methods pursued in regard to the search for antiquities on the continent of Europe, and notably in Italy, where the foreigner is excluded, and where neither the sale nor the exchange of a single object is allowed. On the other hand, we find attached to the Museum of Ghizeh a conspicuous department, devoted to the sale of authenticated objects which may be duplicated many times over, and are therefore not wanted in a scientific and much less in a popular collection. Consider what the saving of all the duplicate specimens found at Pompeii, or even in Rome, really implies. It means the useless hoarding, and possibly the eventual loss or destruction, of almost countless numbers of objects, large and small, parts of statues, bits of sculptured frieze and cornice, amphoræ, fibulæ, and utensils of every description and in endless array. Thousands of marble fragments, which might be sold to advantage, and which would be prized by many small museums, are left exposed to rain and dust or piled up in dark chambers in various parts of Italy, apparently on account of this short-sighted policy, and through fear of letting down the bars at a single point.

It is a pleasure to acknowledge the able manner in which the French, aided by the admirable work of the Egypt Exploration Fund and by private enterprise, have successfully mastered the difficult task of bringing to light, and in some measure restoring, as well as guarding for the future, the wonderful monuments of ancient Egypt, scattered as they are along the desert borders of the plain of the Nile for over 500 miles, from the Delta to Nubia, often remote from towns and from every convenience of modern life, and suffering from the neglect and worse abuses attending the vandalism of 2,000 years. Every great monument is now under the charge of guards, and every new tomb of importance which is now unearthed, is fitted with a modern door and placed under lock and key. It is a little surprising, on the other hand, that certain excavators who rob the graves of the ancients for the benefit of science, should pay so little respect to the remains which are left behind. At Assuan, Thebes, Benihasan, and Sakkara the bones of the ancient dead lie scattered over the sand like the chips in a lumberman's camp. At some of these places I picked up perfect skulls, and could have filled many barrels with the bones which the shifting sands of the desert had not yet concealed. When these human remains are not wanted by the excavator, it would seem proper that they should be either replaced, buried in a single grave, or at least sent to anatomical museums.

Thebes itself, which at an early day had come to embrace Karnak and Luxor, as well as a long strip to the west of the Nile, is to many students the central point of interest in Egypt, while its ancient necropolis, rising in desolate grandeur from the plain, is one of the most impressive spots in the world. The journey across the river and the Theban plain from Luxor, or, better, a ride over the wider and more diversified strip of tilled land on the east bank, affords a valuable introduction to the necropolis itself, so striking is the parallel between the field-life of to-day and the life of men and animals depicted on the walls of the ancient tombs. Still can we see the wide fields of long-bearded wheat, already, in early April, ripe for the harvest. The field-hands are many, and some, with short sickle in hand, their brown backs bared to the sun, and protected only by scant breech-cloths, are still reaping in the old way and with the old tools, stopping every little while to bind in small sheaves the garnered wheat. We pass a threshing-floor for lentils—that vegetable which suggests the flax and, when ripe, turns to a bright yellow-green; then another for the coarse but well-flavored Arab beans. Each is but a cleared space of ground, on which the dried crop is piled, while yoked cattle, driven over it, round and round, in a narrow circle, for many hours, slowly tread out the pulse in the grain, at the same time mixing it with plenty of grit.

In the large threshing-floors, which cover two or more acres, the threshing sledge or roller is commonly used, and a dozen may be seen in action at one time. This tool, though not occurring on the monuments, is undoubtedly very ancient. It consists of three revolving axles, each carrying a number of circular iron discs, and rigged to a hand-hewn wooden frame. When this heavy machine is trundled by means of oxen round and over the grain for many hours, the edges of the discs on which it rests are sufficiently sharp to gradually chop the straw very fine, thus releasing the grain without crushing it. At the same "floor" one may also see the old winnowing fan, "fork," or basket still in use. One should add that, in parts of the Delta, large model farms are to be found, fully equipped with modern agricultural machinery, including, I am told, the steam-plough; but these have no effect on the rest of the country, and in Upper Egypt the tools of the men who labor so industriously in the fields have not essentially changed in four thousand years.

Next to tilling the ground, the great occupation of the Egyptian peasants, during the dry season, is carrying water from the Nile in earthen jars and goatskins to the houses, or lifting it by shâdûf or sakîyeh (the well-sweep and the wheel) and sending it coursing through an ingenious system of canals to every part of those fields where the crops are still green or the season of growth is yet to follow. Brown shâdûf men, bare-headed and stripped to the belt, keep the well-sweeps in motion, and night or day the creaking of the sakîyeh seldom ceases, at least at critical periods. The shâdûf, which occurs more than once on the monuments, is seen in its simplest form in Upper Egypt, where it consists of two columns of sun-dried mud, with or without a core of durra-stalks, for supporting the pole, a large lump of Nile mud for counterpoise, and, for the bucket, a basket of palm-leaf or coarse cloth. For the same purpose Archimedean screws are in use in the Delta, and in parts of Upper Egypt a curious modification of the "sweep," where it is necessary to raise the water from but one to two feet. A man standing in the canal, works up and down, see-saw fashion, a long narrow trough or scoop which is weighted at the open end, where the water escapes.

The fields are checked with the greens and yellows of growing and ripening crops, and with the rich umber browns of the newly ploughed soil. It seems probable that the characteristic checkerboard ornament, as well as the irregular quadrangular designs which we see on the early monuments, such as the many stelæ, the decorations of the sarcophagus chamber in the pyramid of Onnos, which dates from the Fifth Dynasty, and of the sarcophagus itself, were suggested by the checkered patterns of the river valley where those simple figures were ever before the eyes of the early dwellers on the borders of the plain.

It is often said that the modern Egyptian plough, the counterpart of which is seen in both ancient painting and sculpture, only scratches the soil, but this is a mistaken idea, and based on theory only. I have watched the ploughing in the fields, and can affirm that this wooden implement, which has an iron shoe, strikes a sufficiently deep if too narrow furrow. Its upright fork or handle is of little use, for no pressure of the ploughman is commonly required. Its heavy beam and wide crossbars which hold the yoked animals, be they buffalos or cows, or even cow and camel, full six feet apart, serve also to keep the point of the plough well in the ground. The soil of Egypt is a soft, fine loam, without a root or stone; and as nearly all the arable land is submerged for a part of the year and is therefore the bed of the Nile, it is as level as a floor. The function of the plough is to stir up the hard, sun-dried loam, especially after the winter crops are harvested in March and April; and whenever the fields have become hard and dry the fellâhîn go over the fields after ploughing and break up all the hard lumps of earth with their primitive, short-handled hoes. If they would introduce the American harrow, it would save them an immense amount of labor, even if they still clung to the wooden plough, which is by no means an ineffective tool.

Hundreds of small crested larks, which are said to resemble the English skylark in all but their song, rise from the wheat and barley and drop down in the path, some with straws for nests or food for their young; and the very moment their feet touch the mother earth, up spring their vertical crests as if they had received a galvanic shock. Their colors are those of the brown Nile soil, and on Queen Makere's temple, hard by, you will see their clean, beautiful profiles cut in sharp relief, and repeated many times. The hoopoos, those beautiful targets of the feather-hunting Italian, Greek, or Arab, fly like the American highhole or flicker, but nearer the ground; and the moment they alight their great black-tipped, cinnamon-colored crowns begin to expand. They probe the earth for insects with their long downward-bent bills, and in rest show one of the boldest black-and-white patterns to be seen in the plumage of any bird. A series of very broad black-and-white bands travers-

ing both wings and tail produce a striking "flicker" effect when they fly. In the early morning as well as in the heat of the day you hear their loud cuckoo-like call—Hoop-hoop-hoop-oop-oop-oop! The stress is laid on the first two or three notes, dying out with the last, while the pumping motions of head and tail are curious to observe. The hoopoo appears on the fine tomb of Ptah-hotep at Sakkara, where slaves, bringing them alive as offerings, hold them in the hand by the wings.

The date palm, now in flower and ready to be fertilized by the guild of Nubian climbers who make this their business in March and April; the tamarisk, whose fine blue-green sprays suggest the red cedar or the tropical Casuarina; the green cucumber, looking like an unripe squash, marked with light and dark green stripes; goat-skins and clay-colored pottery in graceful forms, used for carrying, storing, or cooling water; dishes and utensils, tools of the farmer and artisan, literally hundreds of objects, the products of nature or the device of men—can be seen in modern Egypt, while their prototypes are all carefully figured on the temples or in the tombs.

High amid the grand and desolate ravines of Bibân el-Mulûk the tombs of the kings descend by a series of corridors deep into the heart of the native rock—a beautiful limestone interspersed with nodules of flint, weathering to a golden brown color, but below the surface suggesting masses of frozen cream. It has a delicate texture, splits with a conchoidal fracture, and can be cut and polished like a cameo, as is well seen at Dêr el-bahri or in the beautiful low reliefs which cover the walls of the stately chambers once the tomb of King Seti the First. At Shêkh Abd el-Kurna, the tombs of the grand viziers and princes of Thebes were mostly cut into the perpendicular face of the cliffs, but were not, as a rule, carried below the superficial layers of splintered and fissured stone. Their walls, with few exceptions, were therefore covered with a coating of mortar or staff made of Nile mud with a liberal admixture of ground straw, identical with the material which the modern Arab often uses to plaster a fence or wall. These tombs are commonly T-shaped, and their outer door admitted directly to a chapel or vestibule, which corresponds to the cross-bar of the letter. The real door of the vault or sarcophagus chamber lay in front of the entrance, and was sometimes built up altogether, or concealed by the stela, before which stood the table of offerings. At one end of the vestibule we sometimes find a blind door, usually painted in imitation of red granite, while at the end of the tomb-chamber, beyond the sarcophagus and its enclosed mummy, was a niche or serdâb for statues of the deceased. Again, the stela was sometimes fixed in another part of the vestibule in order thus more effectually to conceal the real door of the tomb and to baffle the ingenuity of grave-robbers, who began to despoil the royal cemetery even in ancient times.

Stela, table of offerings, mummies, and generally the statues—in a word, all the movable contents, with few exceptions—have been taken from the Theban tombs. In the well-preserved and tastefully decorated tomb of Anemophis the Second, discovered in 1898, the mummy of the dead king still rests in its sandstone sarcophagus in the royal crypt. In one of these rock tombs at Bibân el-Mulûk an electric power plant has been installed, and the grim features of the old king can be seen by all the world under the glow of an incandescent light. The transition seems perfectly appropriate, and it is a pity that more electric lights cannot be placed in darkened precincts elsewhere as in the beautiful tomb of Ti at Sakkara.

The mural paintings which fortunately remain in many of the smaller tombs and are among the most interesting relics of antiquity possess an even higher degree of interest when we reflect that they were not primarily designed to be seen by human eyes, but only by the dead and their spiritual representatives. So clean is the stucco, and in many cases so bright and fresh are the colors, especially at Thebes, that it is impossible to realize that some of those admirable friezes and ceiling designs, and those almost endless studies of men and animals in action, were conceived and executed over two thousand years before the traditional founding of Rome. The zenith of Egyptian art, however, was reached as early as the Fifth Dynasty, or over four thousand years ago, as is well shown in some of the Memphite tombs at Sakkara. No great civilization of the ancient world has left such abundant historical documents, pertaining to religion, the arts, and daily life, as the Egyptian; but to realize this fully one should come to Egypt fresh from a study of the sadly mutilated remains of Italy or of Greece.

FRANCIS H. HERRICK.

Correspondence.

THE ARUNDEL CLUB.

TO THE EDITOR OF THE NATION:

SIR: Thanks to your kindness in inserting Mr. Berenson's letter about the movement recently initiated here for the publication of photographs of precious works of art in private collections in England and elsewhere, we have received from the United States a great number of inquiries and adhesions, some addressed to me, others to our honorary secretary, Mr. Robert Ross, No. 10 Sheffield Gardens, London, W. The minimum number of members necessary for the formation of the Society has thus been reached and passed, and we are now collecting and preparing for issue before the end of the year the first annual series of about fifteen prints. My object in writing to you is not merely to announce our success, but to state that it is largely due to the coöperation we have received from the United States—a coöperation resulting almost entirely from the publicity you have given to our proposal, for which kindness of yours we are sincerely grateful.

As so large a number of our members are United States citizens, it has occurred to me that it might be more agreeable and convenient to them to form themselves into a separate branch, with a committee of their own. Such an organization would facilitate the distribution of the photographs and would enable custom-house formalities to be accomplished without causing trouble to each individual subscriber. The criticism and advice of such a committee would be welcomed by us. Moreover, there are already many important old works of art in the possession of individuals in the United States, and every year sees their number increase. A photographic record of them is not less desirable than of similar works in private ownership here; but to discover them and obtain permission to photograph them must be the work of an American committee. The Egypt Exploration Fund, with its double organization on the two sides of the Atlantic, sets an example which I think we ought to follow. Our honorary secretary, Mr. Ross, will be very glad to receive communications and suggestions as to this matter.—I am, yours faithfully,

MARTIN CONWAY.

THE RED HOUSE, HORNTON STREET, LONDON, W., June 9, 1904.

THE DIRECTORSHIP OF THE NAPLES MUSEUM.

TO THE EDITOR OF THE NATION:

SIR: During the directorship of Professor Pais, students and tourists alike have had ample reason for complaint in the reorganization of the Museo Nazionale in this city. Indeed, it has been rather a work of disorganization. As was to be expected, a new broom may sweep clean. Under a new management radical changes may legitimately occur which will render invalid all existing guidebooks to the collections—changes which cause an upheaval of greater or less duration, so that certain sections of the museum must needs be withdrawn from public inspection. Natural and logical changes executed with skill and taste based upon sound scholarship are what is demanded of a suitable director. It would seem that Prof. Pais has proved his utter incompetence for the task of managing a museum in a modern or scholarly manner. But perhaps it is not so much on this account as upon grounds of infidelity and rank mismanagement of affairs that yesterday afternoon the King signed a decree for his dismissal from the coveted post. There has been chosen as a temporary substitute or "regent" Cavaliere Giovanni Gattini, treasury inspector, and a member of the board that sat in judgment upon the weird doings of Pais.

The specific charges against Prof. Pais are of twofold nature. He is accused (and does not deny the accusation) of having raised the sum of over 300,000 francs more than his proper appropriation by pledges involving the museum. For this irregularly obtained sum he paid 6 per cent. interest. The character of the second set of charges brought against him is immediately less serious, but none the less highly unsatisfactory. The arrangement of the collections prior to Pais's arrival upon the scene as Director was not ideal, but was in many ways not condemnable. The principal trouble then was the undue crowding of the chief masterpieces (particularly marbles) into an inadequate space, so that, for instance, the Venus of Capua could not well be inspected by more than one person at a time; and it was so placed next a wall that it was poorly lighted and not approachable from all sides. For over a year Professor Pais has made it impossible for many students and thousands of tourists to visit the collections to any advantage; and, more than that, has stripped the visitor

of all means of identification by opening the rooms before so much as even a provisional catalogue was issued or any system of labelling was adopted. In a less degree the experience of a resident English professional man of parts is that of every one desirous of examining the museum's treasures. Only yesterday he was telling me how for years he had been used to enjoy his weekly visits to the marbles and bronzes, and had come to love them in their relations one to another as old friends. Now he deplored having to journey aimlessly up and down the tawdrily decked-out corridors in search of his particular favorites. Without the slightest sense of scientific taste or scholarly instinct, Professor Pais has caused to be placed together, according to some strange canon of bilateral symmetry, unrelated statues or busts stood at equal removes upon pedestals of like color and size, two by two! He has done worse than that. He has garishly arranged the rooms as though each were the salon of some Roman *nouveau riche*, symmetrically set out to the best scenic advantage without the remotest suggestion of archæological law or order or accuracy.

The harsh, not to say ridiculous, clash of effects is bound to gall the justly patriotic Neapolitan, as it surely brings a sneer to the lips of one familiar with sentiently composed museums. Only yesterday a Neapolitan artist was bitterly girding at Pais's brutal denseness as we walked through the Pinacoteca, the floors of which are partially covered with genuine Pompeian mosaic, obviously so priceless that it should never be subjected to the wear of ordinary shoes or rustic hobnails. The pictures in this small but partially admirable collection are, as well as the statues below stairs, grouped according to the same idiotic criteria of bilateral symmetry, as to both color and size. Worse than this, there are eight rooms full of paintings quite unsorted and not exhibited! However, they are at least shut away, and have not as yet been subjected to the capricious and servile generosity of some of the antiques in the basements, several examples of which the henchman Pais is reported to have sent to his patron, Nasi, the discredited ex-minister.

For many months a storm has been brewing. The great majority of the best archæologists in Italy have been opposed to the recent suicidal administration, and so eminent a man as Prof. B. Croce came out last autumn in a scathing rebuke of the director's unfitness for his position. To many overt and covert attacks Pais has made irritated retorts, even calling his critics asses. His nature is well exhibited by an incident reported some weeks ago in a local paper. It seems that, for one cause or another, Pais fell into a pet and shivered a valuable vase into small bits. The paper went on to say, satirically, that there was evidently no reason why he should stop at such trifles as Greek vases when he might feel at liberty to shatter a whole basementful of fragile friezes and unexhibited marbles.

Professor Pais has acted most strangely in his own defence. He is reported to have at first denied all complicity in or knowledge of the mismanagement of funds illegitimately acquired, and in the next breath to have admitted all the accusations one by one. He tries to exculpate himself by asserting that the ex-minister Nasi (now hiding in some foreign nook) gave him *carte blanche* in the framing of the museum budget and in the subsequent expenditure of it. T. D. B.

NAPLES, June 7, 1904.

THE TRANSFORMATIONS OF BEHEMOTH.

TO THE EDITOR OF THE NATION:

SIR: Are your pages open to an Orientalist to bring forward a tiny point—but one curious and, perhaps, significant enough—at which seemingly East and West join? He would seek aid from students of mediæval Europe. In the cosmography of Islam, borrowed from the cosmographies of India, the world is depicted as a series of stages, one below the other, supported by an angel, a bull, a green stone, a great fish, the sea, the back of the wind, the power of Allah. The fish has, in Arabic fashion, three names. Long ago, Fleischer pointed out that two of these are derived from Behemoth and Leviathan in the Book of Job. More recently, in the *American Journal of Semitic Languages* (April, 1899), I pointed out that the third name was also derived from a word common in Job, and very rare elsewhere. So much for the East.

In Mr. Andrew Lang's 'Monk of Fife,' one of the characters is represented (I cannot find the reference at present) as swearing by Behemoth. Mr. Lang is not an inventor of strange oaths, and his color may be relied on, but, until a few weeks ago, I had no parallel for this treatment of Behemoth as either deity or demon. Then, however, in Epiphanius's 'Lives of the Prophets,' printed in Nestle's little Syriac chrestomathy, compared with the parallel Greek texts given by Migne, Behemoth turned up again as a deity in good and regular standing. In the Syriac text (lines 168, f.) we are told of Nebuchadnezzar that he was in the form of Behemoth. But one of the Greek versions given by Migne (Patrol. Græca, xliii., col. 404), apparently translated and muddled from a fuller Syriac text than we have, says that he was δεόμενος τοῦ θεοῦ Βεημὼν, ὅ ἐστιν τοῦ θεοῦ Ἰσραήλ. So here we have Behemoth turned into the God of Israel. Apparently, also, from the reference to Ephrem Syrus, given in Brockelmann's 'Lexicon,' some Syrians explained Behemoth in Job as meaning Satan.

My queries now are two: Can any further light be cast on the Western use and interpretation of Behemoth? And, second, has Behemoth had any part in the mystery of the Baphomet of the Templars?

Very truly yours,

DUNCAN B. MACDONALD.

HARTFORD, CONN., June 13, 1904.

THE HUNTING PASSAGE IN MIDSUMMER NIGHT'S DREAM.

TO THE EDITOR OF THE NATION:

SIR: I find in the commentaries no sufficient illustration of M. N. D. 4. 1. 108-124, either from ancient or modern literature, and therefore contribute one from Gervase Markham's 'Country Contentments' ("The Eleventh Edition, Newly Corrected, Enlarged," etc. London, 1683), a part of which was quoted by Baynes on the passage a generation ago. The Shaksperian passage is:

Theseus. Go, one of you, find out the forester;
For now our observation is perform'd;
And since we have the vaward of the day,
My love shall hear the music of my hounds.
Uncouple in the western valley; let them go:
Dispatch, I say, and find the forester.
(*Exit an attendant.*)
We will, fair queen, up to the mountain's top
And mark the musical confusion
Of hounds and echo in conjunction.

Hippolyta. I was with Hercules and Cadmus once,
When in a wood of Crete they bay'd the bear
With hounds of Sparta; never did I hear
Such gallant chiding; for, besides the groves,
The skies, the fountains, every region near
Seem'd all one mutual cry: I never heard
So musical a discord, such sweet thunder.

Theseus. My hounds are bred out of the Spartan kind,
So flew'd, so sanded, and their heads are hung
With ears that sweep away the morning dew;
Crook-knee'd, and dew-lapp'd like Thessalian bulls;
Slow in pursuit, but match'd in mouth like bells,
Each under each. A cry more tuneable
Was never holla'd to, nor cheer'd with horn,
In Crete, in Sparta, nor in Thessaly;
Judge when you hear.

The more important passages from Markham are those which follow (pp. 3-9). These, as will be seen, have chiefly reference to the music of the cry, and to the breeds and sizes of dogs in relation to the music; but other illustrations will be found in the mention of the long ears and the flews (some of the important words are italicized to emphasize these points). It is evident that Shakspere's favorite hound (at least, judging from this play) is the large West of England dog, and that he imagines, or wishes to produce the impression, that the harmony can be produced by these alone. That he admires long flews is shown also by "Venus and Adonis," 919-922:

When he hath ceased his ill-resounding noise,
Another *flap-mouthed* mourner, black and grim,
Against the welkin volleys out his voice,
Another and another answer him.

The following quotations reproduce the original, except that the names of the English shires, and nothing else save the word "Beagle" in the first paragraph, are there in italics:

"Now of these Hounds there are divers kinds, as the *slow* hound, which is a large, great dog, tall and heavy, and are bred for the most part in the West Counties of this Land, as also in Cheshire and Lancashire, and most woodland and mountainous countries; then the middle siz'd dog, which is more fit for the Chase, being of a more nimble composure, and are bred in Worcestershire Bedfordshire, and many other well mixt soyls, where the Champain and Covert are of equal largeness, then the light, nimble, swift, slender Dog, which is bred in the North parts of this Land, as Yorkshire, Cumberland, Northumberland, and many other plain Champion Countries: and lastly, the little Beagle, which may be carried in a mans glove, and are bred in many Countries for delight only, being of curious scents and passing cunning in their hunting; for the most part tyring, (but seldom killing) the prey, except at some strange advantage. . . .

"For the shape of your Hound, it must be according to the Climate where he is bred, and according to the natural composition of his body, as thus: If you would chuse a large, heavy, *slow*, true, Talbot-like Hound, you must chuse him which hath a round, big, thick head, with a short nose uprising, and large open nostrils, which shews that he is of a good and quick scent, *his ears exceeding large, thin and down-hanging much lower than his chaps, and the flews of his upper-lips almost two inches lower than his neither chaps*, which shews a merry deep mouth, and a loud ringer, his back strong and streight, yet rather rising, than inwardly yeilding, which shews much toughness and indurance; his fillets will be thick and great, which approves a quick gathering up of his legs without pain, his huckle bones round and hidden, which shews he will not tire, his Thighs round, and his Hams streight, which shews swiftness; his Tail long and rush-grown, that is big at the setting on,

and small downward, which shews a perfect strong chine, and a good wind; the hair under his belly hard and stiff, which shews willingness and ability to endure labour in all weathers, and in all places: his legs large and lean, which shews nimbleness in leaping or climbing; his Foot round, high knuckled and well clawed, and a dry hard sole, which shews he will never sorbait; and the general composure of his Body so just and even, that no level may distinguish whether his hinder or fore-part be the higher: all which shew him of much ability, and that in his labour he will seldom find any annoyance. But if you will chuse a swift light Hound, then must his head be more slender, and his nose more long *his ears and flews more shallow*, his back broad, his belly gaunt, his tail small, his joynts long, his foot round, and his general composure much more slender, and Gray-hound-like; and thus in the generality for the most part, are all your York-shire Hounds, whose vertues I can praise no farther than for scent and swiftness: for to speak of their mouths they have only a little sharp-sweetness like Gig, but no depth or ground like more solemn *musick*. . . .

"If you would have your Kennel for sweetness of cry, then you must compound it of some large dogs, that have deep solemn Mouths, and are swift in spending, which must as it were bear the base in the consort; then a double number of roring, and loud-ringing Mouthes, which must bear the counter-tenor; then some hollow plain *sweet* Mouthes, which must beare the mean or middle part; and so with these three parts of *Musick*, you shall make your cry perfect: and herein you shall observe, that these Hounds thus mixt, do run just and even together, and not hang loose off from one another, which is the vilest sight that may be; and you shall understand that this composition is best to be made of the swiftest and largest deep-mouthed dog, the slowest and middle-sized dog, and the shortest-legg'd slender dog, amongst these you may cast in a couple or two small single Beagles, which as small trebles may warble amongst them: the cry will be a great deal the more *sweet*.

"If you would have your Kennel for loudness of Mouth, you shall not then choose the hollow deep Mouth, but the loud clanging Mouth, which spendeth freely and sharply, and as it were redoubleth in utterance: and if you mix with them the Mouth that roreth, and the Mouth that whineth, the cry will be both the louder and the smarter; and these Hounds are for the most part of the middle size, neither extream tall *nor extream deep-flewed* such as for the most part your Shrop-shire, and pure Worcester-shire dogs are, and the more equally you compound these mouths, haveing as many Rorers as Spenders, and as many Whiners, as of either of the other, the louder and pleasanter your cry will be, especially, if it be in sounding tall woods, or under the *eccho* of Rocks.

"If you would have your Kennel for depth of mouth, then you shall compound it of the largest dogs which have the greatest mouths and *deepest flews*, such as your West-Countrey, Chesheire. and Lancasheire dogs, are, and to five or six base couple of mouths, shall not add above two couple of counter-tennors, as many means, and not above one couple of Rorers, which being heard but now and then, as at the opening or hitting of a scent, will give much *sweetness* to the solemness. and graveness of the cry, and the *Musick* thereof will be much more delightful to the ears of every beholder. . . .

"And now to return to my purpose; your Kennel thus composed of the swiftest Hounds, you shall as nigh as you can, sort their mouths into three equal parts of *Musick*, that is to say Base, Counter-tenor, and Mean; the Base are those mouths which are most deep and solemn, and are spent out plain and freely, without redoubling: the Counter-tenor are those which are most loud and ringing, whose sharp sound pass so swift, that they seem to dole and make division; and the mean are those which are soft sweet mouths, that though plain, and a little hollow, yet are spent smooth and freely; yet so distinctly, that a man may count the notes as the open. Of these three sorts of mouths, if your Kennel be (as near as you can) equally compounded, you shall find it most perfect and delectable: for though they have not the *thunder* and loudness of the great dogs, which may be compared to the high wind-instruments, yet they will have the *tunable* sweetness of the best compounded consorts; and sure a man may find as much Art and delight in a Lute as in an Organ."

As the first edition of Markham's work did not appear until 1611, Shakspere can hardly be indebted to it, unless it had been in circulation in manuscript for some years previously, which is not impossible, seeing that Markham was born about 1568, and that he was known as an author before "Midsummer Night's Dream" could have been written. More probably, however, both works reflect facts and ideals current at the time.

ALBERT S. COOK.

YALE UNIVERSITY, June 4, 1904.

Notes.

An illustrated work, Weale's 'Mantchuria,' is promised directly by Macmillan Co., along with 'War Neutrality in the Far East,' by Dr. T. J. Lawrence.

Howard Duffield is one of the ministers of the gospel who find in Wagner's "Parsifal" a work not to be attacked, but eulogized. In his 'Parsifal the Guileless Fool' (Dodd, Mead & Co.) he maintains that the scope of this music-drama "is encyclopædic; that it runs the gamut of experience; that it sweeps a circle of influence as vast as the horizon of human opinion." He undertakes, among other things, to show why the Pilgrim Fathers and Washington and Lincoln were "guileless fools" like Parsifal. The 'Parsifal' by the Rev. H. R. Haweis (Funk & Wagnalls) is a reprint from one of his books, which those who have heard or expect to hear Wagner's last work may read with interest and profit. It is an account of a Bayreuth performance in 1883.

When a teacher or author of a treatise for singing-teachers and pupils begins, as Salvatore Marchesi does in his 'Vademecum' (Schirmer), by declaring that "the best traditions of the art of singing are, with very few exceptions, nearly lost," he shows such ignorance as to the present golden age of song that one feels tempted not to read on. His little treatise of forty-eight pages, nevertheless, contains useful hints and sensible remarks. Percy Goetschius's 'Counterpoint Applied' (Schirmer) and Benjamin Cutter's 'Harmonic Analysis' (Oliver Ditson) are meritorious books for serious students of music. Luigi Lombard's 'Osservazioni di un Musicista Nord-Americano' (Milan: Fratelli Treves) is an Italian version of a series of short talks on musical subjects which appeared in this country a few years ago.

When such a production as 'Book-Lovers, Bibliomaniacs and Book Clubs,' by Henry H. Harper, privately printed, and written "for the exclusive use of the members of a private book club" in Boston, comes to our hands through the courtesy of the author, literary criticism is obviously impertinent. To the highly select public which this author addresses, his remarks may be replete with novelty and interest, or may have some subtle and peculiar charm which eludes an outsider. But the veriest outsider can appreciate the exquisite typography of this little volume.

Mr. Macray's leisurely (because laborious) 'Register of the Members of St. Mary Magdalen College, Oxford' (Henry Frowde) reaches volume four, and, after the customary extracts from the registers and accounts which reflect the manners and customs of the period, presents biographical sketches of the Fellows from 1648 to 1712. This embraces the two English Revolutions; and if on the one hand we see the Parliamentary soldiers garrisoning Oxford in 1648 abused by one George Nicholson, M.A., Demy, and Curate of Horspath, not unmindful of their battering the college chapel in 1642 on the entry into Oxford, on the other we have in 1688 the "intruded Fellows" of King James II.'s Catholic nomination, including John Dryden, son of the poet. Intrusion for intrusion, Mr. Macray pronounces the Parliament's based on learning and ability, in most instances; the King's, chiefly on agreement with him in religion.

The well-known secretary of the Charity Organization Society of London, Mr. C. S. Loch, has collected a number of papers relating to social reform in a volume entitled 'Methods of Social Advance' (Macmillan). These papers are the result of discussions that have taken place at meetings of the Council of the Society, and are of interest as showing the views of those engaged in its practical work. Perhaps the most striking contribution is the account given by Mr. George Livesey of the "industrial partnership" in the South Metropolitan Gas Company. In the course of a dozen years nearly every man employed has become a stockholder, and their interest now amounts to £170,000, or an average holding of £40. Mr. Livesey maintains that the system can be employed as well in other industries as in gas works. It has put an end to strikes; but the trade-unions oppose its extension, and the Socialists do not favor it.

In this connection we may mention Mr. Nicholas Paine Gilman's 'Methods of Industrial Peace' (Houghton, Mifflin & Co.). It treats of combinations of employers and combinations of laborers, and then discusses the contests arising between these organizations, the necessity of regulating them in the public interest, and the methods by which they may be prevented or settled. The factory system, under which great numbers of workmen are brought together, seems to lead almost inevitably to "collective bargaining"; a process which is very carefully examined. The functions of boards of conciliation and arbitration are stated, and there are special chapters on legal regulation of disputes in industries of the nature of monopolies, and on the New Zealand experiment. Mr. Gilman speaks favorably, on the whole, of trade unions; but he insists on the absolute necessity of preserving order, and of ending such controversies as that which paralyzed the anthracite coal trade two years since. Some documents of interest are presented, such as the New Zealand law, and the rules of certain trade associations. Mr. Gilman takes a hopeful view of the future; and if the parties to industrial quarrels would follow his advice, the world would be much happier.

As to trade unions, Mr. Edwin A. Pratt, who discussed their methods a year or two ago in the London *Times*, has republished his letters in a volume entitled 'Trade

Unionism and British Industry' (E. P. Dutton & Co.). Some startling facts are stated by Mr. Pratt, such as the diminution of the work done by bricklayers. Thirty years ago some men laid 1,200 bricks in a day, and twenty years ago 1,000 bricks were laid in ordinary work. Now the bricklayers' union fixes the maximum tale at 400, and the London County Council is said to call 330 "a fair day's work." Mr. Pratt describes the effects on a number of trades of the union policy of restricting production; but his charges are in most cases rather vague. The number of causes that may affect the prosperity of any industry is so great as to make it very difficult to prove that a decline in its productiveness is due to any particular influence.

More favorable views of trade unions are to be found in 'Elementary Principles of Economics,' by R. T. Ely and G. R. Wicker (Macmillan). We are reminded that employers have sometimes given secret encouragement to strikes when they wished to close their works for a time, and that the real aim of the unions is to raise the workman's standard of life. "The use of 'Union Labels' placed upon goods made by union labor under conditions satisfactory to the organization is becoming increasingly frequent and effective." As is to be expected in writings of this class, protective tariffs are gently handled, although it is admitted that "it is impossible to tolerate permanently a bad condition of things, and we are justified in demanding that there shall be progress in our tariff policy." The enormous increase in public expenditures must not be thought due to recklessness or dishonesty. "Government activity, while wiser than before, is also more extensive and important." It is conceded, however, that it is "at least regrettable that 70 per cent. of the regular Federal expenditures are due to past wars and to the preparation for war." Why does it not occur to our economists that the cause of labor would be more advanced by abolishing this expenditure than by all other expedients?

Among the scholars of an uncreative age, the history of criticism naturally attracts considerable attention, and no small share of their researches has been devoted to the period of critical origins in the Renaissance. Two volumes of a collection of "Elizabethan Critical Essays," edited by a most competent scholar, Mr. G. Gregory Smith, have just issued from the Clarendon Press; but most of the historical studies on the Continent have concerned more directly the Italian critics from whom the Elizabethans, like all other Renaissance men of letters, drew their inspiration. Among the most interesting and influential of these critics was Lodovico Castelvetro, who is important as the first to formulate with precision the so-called "dramatic unities," and whose work directly influenced Sir Philip Sidney's 'Defence of Poesy.' A young scholar, G. Cavazzuti, last year published an extended monograph on the life of Castelvetro and on the state of Modenese culture during his lifetime; and there now comes to us an important treatise by another Italian scholar, Antonio Fusco, 'La Poetica di Lodovico Castelvetro' (Naples: Luigi Pierro), in which this critic's poetic theory is historically and philosophically considered. The study of poetic theory is essential to a proper understanding of the changes of literary taste and the historical development of criticism. In the case of Castelvetro this is of especial significance, since his *magnum opus* is a commentary on Aristotle's 'Poetics' (1570), in which an independent and in some senses a very modern mind searchingly examines the basis of Hellenic theory, and prepares the way for the neo-classic canons of the century that followed. Dr. Fusco has not approached his theme in the mere spirit of pedantic erudition, but studies Castelvetro's poetic theory from the standpoint of the latest æsthetic conceptions. The book will interest students of æsthetics scarcely less than those directly occupied with the history of literary criticism.

The first volume of Eduard Fuchs's 'Die Karikatur der Europäischen Völker' (Berlin: A. Hofmann & Co.) was published nearly three years ago, and was noticed in these columns. It gives a history of European caricature from its origin and earliest development to the year 1848. The second volume, which has just appeared, covers the period from 1848 to the present time. It contains 515 illustrations in the text and 62 large prints, some of them in colors and many of them reproduced from rare copies of prominent art journals and organs of wit and humor; the whole constituting an exceedingly entertaining, epigrammatic delineation of historical events during the latter half of the nineteenth century. In antiquity, caricature seems to have been confined to frescoes, vases, coins, and the grotesque figures of gargoyles; and in the Middle Ages it found expression chiefly in the carvings on the capitals of columns and on the stalls of the chancels in churches or in the miniature paintings of manuscripts. Modern improvements in wood-engraving, in etching on different metals, and in lithographic, heliotypic, chemiglyptic, and other technical processes, gave it a new impulse, contributing immensely to its evolution and extension, and vastly increasing its importance as a factor in the formation of public opinion. Especially interesting and instructive is the author's account of the growth and influence of political caricature during the last thirty years, as well as of the efforts of official censorship to suppress it, which have been successful only in Russia. The work is written in an attractive style, and aims to be popular in its character, but is on that account none the less scientific.

Dr. Edgar Dacque's volume, entitled 'Der Descendenzgedanke und seine Geschichte vom Altertum bis zur Neuzeit' (Munich: Ernst Reinhardt), consists of two treatises, of which the first contains a clear and concise exposition of the modern theory of evolution, while the second gives an historical survey of the doctrine of descent from the earliest times to the present day, beginning with primitive myths of creation and ending with Darwin's 'Origin of Species by Means of Natural Selection,' anticipations and suggestions of which are found in the speculations of ancient philosophers. In this province of thought the Middle Ages, under the dominion of the Romish hierarchy, were utterly barren, owing to the suppression of all researches opposed to the traditions of the Church. Dacque's presentation of the subject is necessarily succinct, but is quite satisfactory.

The State Historical Society of Wisconsin has just published a Descriptive List of the works on English history in its collection, prepared by Dr. Asa Currier Tilton. "This collection," we are told, "numbers about 15,000 volumes, a figure exceeded by few libraries in the United States." The compiler has given chief attention to "the works which furnish sources," like the Rolls Series, the Calendars of State Papers, the Historical MSS. Commission's Reports, the Deputy Keeper's Reports, etc. Even from the Dutch Tank Collection a notable list is made up.

From the Library of Congress comes a Select List of References on the British Tariff Movement (Chamberlain's Plan), compiled under the direction of Mr. A. P. C. Griffin.

Two items of interest in the current report of the Cleveland Public Library Board occur at pages 24 and 43. The Library has parted with its supervisor of children's work to become library instructor in the Normal School, *i. e.*, to teach the classification and arrangement of a library, the use of catalogues, indexes, bibliographies, and other like aids to research, the use of reference books, and the criticism and selection of books for children. In the Library itself a novel feature is the "story hour" for invited pupils of the lower grades in the public schools. "Hero stories" have been told. "The children listen attentively, and invariably ask for the book from which the story is taken."

President Eliot's jubilee fills a large space in the *Harvard Graduates' Magazine* for June, and is illustrated with early portraits. The epoch-making inaugural address of 1869 is fitly reproduced. The most significant new matter is the report of the Committee on Improving Instruction, which has a lesson for all colleges and universities. "Too much teaching and too little studying" is one of its findings. Outside attention should also be drawn to Prof. J. K. Paine's review of the history of the musical department, of which he was the practical founder; but Harvard men themselves may heed the appeal for a separate building for the department, whose utility alike and fruitfulness as an example would be vastly increased by possessing a habitation of its own. In the Corporation records we remark the humble gift of six dollars from "the Japan Club of Harvard University" towards binding books relating to Japan in the University Library.

La Vérité sur le Congo, the organ of the Federation for the defence of Belgian interests abroad, number eight, contains a semi-official "note" on the report of the British consul, Mr. Casement, upon the treatment of the natives by the officials of the Congo Independent State. Considered simply as an answer to the charges of persistent cruelty in the report, without reference to similar testimony from other sources, it has some weight. The decline of population is declared to have been caused by epidemics and the migratory habits of the natives, not, as Mr. Casement says, by their inhuman treatment. This may be true of some districts, but it is not true of others. Lord Cromer, for instance, writes that the Egyptian bank of the upper Nile was dotted with villages, while on the opposite Belgian bank for eighty miles "I do not think any of our party saw a single human being," except the officials and their followers, and the reason is, "the natives are afraid of the Belgians." The charge of systematic cruelty in collecting the taxes is denied, though it is admitted

that isolated cases have occurred. The numerous mutilations alleged to have been made for failure to collect rubber are attributed to native superstitions. A large part of the "notes" is taken up with an examination of a single case reported by the consul. The untrustworthiness of the evidence on which he relies is proved by the fact "that beside Mr. Casement, who questioned the natives, were two Protestant English missionaries of the region, whose presence alone would necessarily bias the depositions." It is apparently impossible to conceive that the presence of Belgian officials at a subsequent examination could exert any influence upon the testimony. A most damaging admission is the statement in this connection that the English Protestant missionaries as a body are "antagonists of the established authority."

The masters of secondary schools in Russia have been directed by the Ministry of Public Instruction to inform their pupils as to the origin and significance of the war with Japan. They must, however, base their lessons in patriotism on a carefully prepared scheme contained in a circular which has been sent to each of them. This begins with a statement of the causes of the expansion of the Empire, and then contrasts favorably Russia's relations with the natives of the acquired territory with those of the Western nations with their foreign subjects, referring among other instances to the present condition of the negroes in the United States and of the native population of the Philippines. Especial emphasis is laid on the fact that "all tribes, even those least advanced in civilization, receive, on becoming incorporated into the Russian Empire, all the civil rights enjoyed by the Russians themselves; to their most conspicuous representatives the way is opened to the highest positions of State, and their families of high birth are received into the ranks of the Russian aristocracy." A similar contrast is to be drawn in the instruction between the wars waged by Russia and the Western nations, pointed reference being made to England's opium war with China. The concluding statement of the introduction is that the United States and England have "thrust forward as an opponent of Russia Japan. . . . They calculated that the war would weaken both Russia and Japan, and would render it easier for themselves to further their own interests."

The weekly edition of the Kobe *Chronicle*, now in its twelfth number, treats of the war between Japan and Russia. Besides a good colored map, each number has a spirited full-page drawing, abundant half-tone illustrations with excellent battle-plans, news notes, and a few reproductions of articles and caricatures from Occidental newspapers, making a collection of documents and pictures that will greatly aid the historian of the present war. The plan of the battle of the Yalu is particularly clear, detailed, and informing. Whatever one may think about Japanese religious opinion, it is certainly a new thing in the history of Japan to read in the text of Admiral Togo's Official Report of the seventh and eighth attack on Port Arthur by the Japanese squadron, that, after attributing much of whatever advantages were gained to the illustrious virtue of his Majesty, he adds, "yet there still remains much in our success which cannot be attributed to human agency. We cannot help firmly believing that it is simply owing to Providential help." Among other documents in this collection of pamphlets is the full text of the correspondence between Barons Komura and Rosen, representing Japan and Russia. Among the illustrations is a full-page one showing nine typical war vessels of Japan, from the many-oared galley of 1848 to the battleship of 1904.

Hawthorne's natal centenary is being celebrated in Salem, Mass., to-day, in advance of the proper 4th of July, by the Essex Institute, with speeches and letters from eminent personages, and in connection with a collection of Hawthorne portraits, manuscripts, first editions, and souvenirs in the Society's rooms. At the same time and in the same city a reunion of descendants of the original immigrant, "the Worshipful Major William Hathorne," is in progress.

—The organization of the work of teaching economics has produced a textbook literature that bids fair to become embarrassing. For years Wayland and Walker monopolized the classroom, but within the last decade this influence has waned, and no one name casts a spell. The result is a large increase of books for high schools as well as for colleges; most of them the creditable productions of the younger university professors. Professor Seager's 'Introduction to Economics' (Henry Holt & Co.) is intended for college work, and, with its many excellent features, has added to the difficulty of making a selection. Under the circumstances it is not profitable to enter into a discussion of much that is on the whole fairly well stated; but in a book whose statements are so well-tempered it is a great disappointment to come upon the discussion of education of our "middle class," *i. e.*, those whose incomes range from $1,500 to $3,000 a year for each family (p. 236). The reference to the public schools might have been made by a high and dry Tory reviewer in *Blackwood's*. There is food for reflection for Mr. Seager to be found in President Eliot's latest Report, in which are figures showing that at Harvard the public high schools carry off the honors; and every wide-awake university professor knows that his university is becoming increasingly dependent upon the public schools for the supply of students. So, to say that the "middle class," "either from necessity or because they undervalue the training offered by high schools and colleges," withdraw their children from school, is unsupported by any observation worthy of the name. The noteworthy increase in high-school attendance, and the fact that the high school is now the feeder of the university, show that Mr. Seager's fears that the children of the middle class "are being shaped all to one common mould," and so stand a fair chance of swelling the mass of mediocrity, are altogether unfounded.

—From the Field Columbian Museum, Chicago, issues 'The Arapaho Sun Dance, the Ceremony of the Offerings Lodge,' by George A. Dorsey, Curator, Department of Anthropology; an exceedingly elaborate and minute description of an Indian ceremony, beautifully illustrated. It has the great merit of being strictly matter-of-fact, devoid of all sentimentalism and subjective attempts at explanation. Dr. Dorsey has conferred a lasting benefit upon students of the Indians of the North American plains. The book is the more valuable since the ceremony will probably not be witnessed many years more. The author says: "That the time is soon coming when the ceremony will be no longer given by any tribe, there is no doubt." "The ceremony of the Sun Dance is performed in compliance with a vow, generally made during winter, but which may be made, however, at other seasons of the year. The vow is in the nature of a pledge, that the speaker will make provision for the erection of the lodge and for the proper performance of the ceremony if the *man-above* will grant him his wish in regard to some particular matter." While in former times torture was, to a limited extent, one of the accessories to the ceremony, it is now, according to Mr. Dorsey, almost completely abolished, and the chief objection to the Dance thereby removed. There is, in fact, nothing in the whole performance to arouse special aversion against it. It will, so the author of this valuable account states, die a natural death like all primitive rites of the kind, and there is no longer any cause for official prohibition. After the thorough description given of it in this book, we shall have few pretexts for regretting its disappearance on the score of ethnologic research. Very interesting, indeed, are the numerous folktales at the end of the book. Like all Indian myths, they are not surcharged with meaning, unless fancifully interpreted, which Dr. Dorsey, who knows too much, is careful and sober enough not to attempt. The origin myth is a valuable contribution to our knowledge of Indian lore.

—The feelings with which Spain—or at least a portion of its inhabitants—regards the advent of the friars compelled to leave the Philippines, are forcibly set forth by Don Viriato Díaz-Pérez in a little work entitled 'Los Frailes de Filipinas' (Madrid, 1904). The evident passion of the writer suggests that his statements should be taken with considerable allowance, but he seems to be thoroughly informed as to facts and details, and if one-half of his indictment be true, it is easy to understand the detestation in which the religious orders were held, excepting the Jesuits, for whom he has no censure. A single case of the many he relates will suffice to render this intelligible. Up to 1874 the Augustinians, he says, held a little property of about sixty acres, known as the Hacienda del Santo Niño de Cebú. Then they spread a report that all the lands of the district not attached to the Santo Niño were about to be granted by the Government to an English company, to found an agricultural colony. When the Indians were thoroughly frightened, the good frailes got them to sign a paper, drawn up in Spanish, which they did not understand, making over their properties to the convent, subject to their remaining as tenants at a rent to be settled every three years. For the first term this was fixed at two pesetas an acre; then it was raised at successive periods until the annual payment was more than the value of the land. The unhappy Indians were unable to pay the rents, and were given forty-eight hours' notice to quit. Their huts were burnt, their cattle were seized, more than five thousand families were driven forth homeless, and flourishing villages like Concepcion and Tolisay were vir-

tually depopulated. Sr. Diaz-Pérez also pays his respects to Fray Nozaleda, the whilom Archbishop of Manila, who has been comforted with the Archbishopric of Valencia, to the effect that he collected $19,000 of unearned salary and evaded all attempts to make him disgorge.

—The *Korea Review*, which, during the present year, has given the reports of eyewitnesses of the naval battle at Chemulpo and of the movements of the Japanese on land, presents in the number for April a diagram of the imperial palace in Seul, which was burned on the night of April 14. This huge collection of buildings, huddled closely together, some purely native in style, some purely foreign, and others still a mixture of the East and West, became a level waste of ashes in a few hours. Korean floors are nothing but stone covers to ramifying flues, through which the smoke and heat of the fire kindled at one end of the house pass out at the other. From one of these overheated flues near woodwork, it seems, the fire started, though no alarm was given until thirty minutes afterwards. When the men of the British legation with their patent fire extinguishers and the American legation guards, Japanese, and others, with buckets and engines, tried to be of service, they found the gates closed and barred. They were foiled at every point, and this largely because of historical and very ancient reasons. The general practice of conspirators against throne or palace has been to start a fire. Hence, by rigid rule, the first care has always been to shut the palace gates and to give access to no one. No outcry or tumult is allowed. Only after these regulations are followed out is the Emperor awakened and informed of the fact that the palace is on fire. Then, and only then, can any attempt be made to quench the flames. With such etiquette, the one thing certain is a devouring fire, which in this case included archives, libraries, gold and silver treasures and souvenirs, besides much else that cannot be replaced. The careless workmen were condemned and nominally banished for a term of years, soon probably to be reprieved. The Old Palace, in which Queen Min was murdered, has been repaired and occupied. The 5th of May, being a lucky day on which a moving can be accomplished without fear of the spirits that overpopulate Korean air, earth, and water taking offence, was selected for the day of occupation. A paper on the condition of Internal Affairs in Korea, by one who has lived in the country eighteen years, shows an appalling condition of misrule, anarchy, brigandage, and cruelty, leaving little or no incentive to industry or enterprise. Professor Hulbert's Korean History begins the seventeenth chapter, bringing down the national story to 1890.

—Those attracted towards the subtleties of Hindu metaphysical thought will find a fresh field of interest in the forty-eighth volume of the "Sacred Books of the East," just published at the Clarendon Press (New York: H. Frowde). The work continues the exposition of the Vedânta Sûtras begun in the thirty-fourth and thirty-eighth volumes, in which Thibaut gave the commentary of Shankara. The present volume complements this Vedânta series by an exposition of the commentary of Râmânuja at the hands of the same capable scholar. Thibaut's claim that Râmânuja's theistic interpretation is truer than Shankara's view has met considerable criticism, and it would have been a valuable addition to the present volume if the translator had expanded his previous argument. The eight hundred pages of translation probably prevented this, but it may be hoped that a full critique of both interpretations will appear in course of time. To the Western reader the great stumbling-block to any interest in the commentaries or even in the texts of Hindu philosophical tracts is the evasion of all discussion by a reference to authority. Scripture decides, not logic. It is curious, however, to see that when authorities disagree (as, for example, in the all-important question of a conditioned or a non-conditioned Brahman), the texts referring to Brahman as devoid of qualities "are of greater force because they are later in order than those which speak of Brahman as having qualities"; and they are "later" simply because they deny; all denial presupposing that which is to be denied. In the dogmatic conclusion of our Hindu philosopher, "thus everything is settled."

RECENT POETRY.

Somewhere in the ample writings of Sir Kenelm Digby there is a quaint and haunting anecdote of one born blind, who yet knew when a candle was brought into the room only by the quickening and reviving of his spirits. Something like this is the essential poetic motive which is exhibited on a stage of epical magnitude in Mr. William Vaughn Moody's 'The Fire-Bringer' (Houghton, Mifflin & Co.). In his prefatory note Mr. Moody informs us that 'The Fire-Bringer' is the first member of a trilogy on the Promethean theme of which 'The Masque of Judgment,' already published, is the second member; but as the Angel Raphael is the chief character of the Masque, it is evident that Mr. Moody has conceived the Promethean theme with a certain largeness, and that the protagonist of the third member is not easily to be guessed. The fable of 'The Fire-Bringer' deals with the lost first part of the Æschylean trilogy—the first, that is, in the temporal sequence of the story, though it was seemingly the last to be played—as Shelley's 'Prometheus Unbound' dealt with the lost third. Like Shelley, Mr. Moody has departed from the traditional notion of the character based on the 'Prometheus Bound.' But his Prometheus is not the Godwinian democrat of Shelley, any more than he is the indomitable anarch of Æschylus; he is, rather, the avatar, with a suggestion of the poetic sky-treader who resembles Shelley himself more than his hero. The structure of the piece is nobly simple. In the first act we have an impressive picture of the world peopled from the stones and clods of Deukalion and Pyrrha, inert and despairing, devoid of light, of heat, of all aspiration and desire. From the contemplation of this despair, and from the quenchless faith of his mistress Pandora, Prometheus conceives his purpose of filching fire from Heaven,

> "To light the passion of the world again
> And fill man's veins with music."

In the second act this is accomplished, and we have a remarkable passage describing the coming of light across the world, quite comparable in nobility and beauty to Milton's Invocation to Light in the third book of his 'Paradise Lost,' or to any of the great prose rhapsodies on the theme of χαῖρε φῶς. In the third act Prometheus, after an eloquent revelation of his forethinking mind, goes collectedly to the doom which he knows to be inevitable.

It is pleasant to be able to say categorically that in poise and purity of tone, in technical adroitness, and in ripeness of thought 'The Fire Bringer' shows an unmistakable advance over 'The Masque of Judgment,' which we found so finely promising three years ago. The perfect imaginative realization of an ideal theme, the masterly composition of a thousand details of classical antiquarianism into a single coherent and beautiful whole, are by themselves sufficient to mark Mr. Moody as one of the finest poetic artists of our time. His art, too, whether consciously or not, is full of intimations and modern meanings for the reflective reader. It is, perhaps, inquiring too curiously to see in the sickening darkness of the first act a poetic foreshadowing of the dull materialism of an age of force worship and scientific agnosticism, or in the mission of Prometheus the perennial life-giving service of the true poet; but one need exercise no ingenuity to be aware how the mood of wonder engendered in a poetic imagination by the science of the hour colors the blank-verse passage that we present as a sample of Mr. Moody's habitual manner, or to feel both the modernity and the sempiternity of the song that we subjoin as a specimen of his best attainment.

> "For you the moon stilly imagineth
> Her loiterings and her soft vicissitudes;
> For you the Pleiades are seven, and one
> Wanders invisible because of you;
> For you the snake is burnished in the spring,
> The flower has plots touching its marriage time,
> The queen-bee from her wassailed lords soars high
> And high and high into the nuptial blue,
> Till only one heroic lover now
> Flies with her, and her royal wish is prone
> To the elected one, whose dizzy heart
> Presageth him of ecstasy and death.
> For you the sea has rivers in the midst,
> And fathomless abysses where it breeds
> Fantastic life; and each its tiniest drop
> Flung from the fisher's oar-blade in the sun
> Has rivers, abysses, and fantastic life.
> For your sakes it was spoken of the soul
> That it shall be a sea whereon the moon
> Has might, and the four winds shall walk
> upon it—
> Also it has great rivers in the midst,
> Uncharted islands that no sailor sees,
> And fathomless abysses where it breeds
> Mysterious life; yea, each its tiniest drop
> Flung from the fisher's oar-blade in the sun
> Has rivers, tempests, and eternal tides,
> Untouched-at isles, horizons never hailed,
> And fathomless abysses where it breeds
> Incredible life, without astonishment."

> "Of wounds and sore defeat
> I made my battle stay;
> Winged sandals for my foot
> I wove of my delay;
> I made my shouting spear;
> Of loss, and doubt, and dread,
> Of weariness and fear,
> And swift oncoming doom
> I made a helmet for my head
> And a floating plume.
> From the shutting mist of death
> From the failure of the breath,
> I made a battle-horn to blow
> Across the vales of overthrow.
> O hearken, love, the battle-horn!
> The triumph clear, the silver scorn!
> O hearken where the echoes bring,
> Down the gray disastrous morn,
> Laughter and rallying!"

Yet if we are to speak our whole mind concerning a poet for whose abilities and serious devotion to the poetic art we have nothing but grateful admiration, we are bound to certain reserves. The form of drama, whether lyrical or not, does not seem to us the form best suited to Mr. Moody's quality. There is always a collectedness in his writing; always a careful manipulation of *sonantia verba et antiqua;* always a laborious attention to *gravis et decora constructio*, which are wholly admir-

able in ode or elegy, but which estop the wings of a lyric, and are likely to rob a drama of due dramatic passion. Mr. Moody softens the chiselled outlines of classic tragedy by many touches of a Virgilian poignancy, many voices of human wistfulness. So he just misses the invincible charm of the pure classic manner, while he never quite attains the spontaneity and unction by which alone any other type of drama justifies its form. In short, like Mr. Stephen Phillips's, whose poetic position is in many respects comparable to his, Mr. Moody's adventures in the dramatic form are not likely to afford true poetic pleasure to as many readers as his earlier and less ambitious pieces have done. We shall welcome the third member of the Promethean trilogy, but we shall hope to see more poems like the noble "Ode in Time of Hesitation" and the tenderly elegiac "Daguerreotype."

In his tragedy of "Tristran and Isolde" (Brentano's) Mr. Louis K. Anspacher shows his ability to write vigorous and passionate dramatic verse, and to make his people use a vivid imaginative speech without falling into the pseudo-Elizabethan manner. He has treated the story of Tristran as the traditional tragedy of fatal love, but he has gone further than most of the poets who have treated it, in reading into the curious *situation à trois* a Euripidean pity and pathos. This he does, chiefly, by sentimentalizing the character of King Mark, who quite makes good Tristran's words:

> "King Mark's full clemency will never fail;
> He is a tree that, wounded, yields a balm,
> Which like a benediction pities all."

The treatment of the familiar story is fresh in its choice of the scenes for presentation; it is always readable, and often finely poetic. But though there are many excellent passages of dramatic clash and surprise, Mr. Anspacher has not been wholly successful in tying and untying his tragic knot. The action is fitful rather than sustained, and Tristran as hero has too much protestation and too little business. He docilely suffers himself to be stabbed both in the third act and in the fifth, which for the purposes of ideal tragedy is once too often.

How admirable, even in an unpoetic age, may be the results of the cultivation of verse writing as a fine art is to be seen in the latest volumes of Mr. Bliss Carman and Mr. John Payne. Mr. Carman's 'Sappho' (L. C. Page) is an unusually successful experiment in quantitative versification, full of the graceful pagan sentiment of which Mr. Carman is so easy a master. The flute-like limpidity of Mr. Carman's verse, a fit expression for the Lydian quality of his sentiment, is as remote as possible from the deathless intensity of the Lesbian. Yet his attempt to recapture her lost odes has resulted in many strophes of pleasant poetry, as will appear from these that follow:

> "When the early soft spring wind comes blowing
> Over Rhodes and Samos and Miletus,
> From the seven mouths of Nile to Lesbos,
> Freighted with sea-odors and gold sunshine,
>
> "What news spreads among the island people
> In the market-place of Mitylene,
> Lending that unwonted stir of gladness
> To the busy streets and thronging doorways?
>
> "Is it word from Ninus or Arbela,
> Babylon the great, or Northern Imbros?
> Have the laden galleons been sighted
> Stoutly laboring up the sea from Tyre?
>
> "Nay, 'tis older news that foreign sailor
> With the cheek of sea-tan stops to prattle
> To the young fig-seller with her basket
> And the breasts that bud beneath her tunic.
>
> "And I hear it in the rustling tree-tops.
> All this passionate bright tender body
> Quivers like a leaf the wind has shaken,
> Now love wanders through the aisles of spring-time."

The knowledge of many words and the delicate instinct for their happy employment which have made memorable Mr. John Payne's translations from French and Italian, Persian, and Arabic, appear to excellent advantage in his 'Songs of Consolation' (Simpkin, Marshall, Hamilton, Kent & Co.). Mr. Payne's poetic vision is not without a measure of that "sad lucidity" which distinguished Mr. Arnold's, and some of his lyrical pieces on themes like resignation and the coming of old age have a poignant directness that is wholly admirable and impressive. We like him better, however, in his dealings with quasi-mediæval themes, where his linguistic antiquarianism and extraordinary metrical ingenuity have freer play. Perhaps the best thing in the volume is "The Coming of the Dove," a poem on the annunciation. The tenderly naïve soliloquy of the Virgin tempts to quotation, but a better specimen of Mr. Payne's quality is the conclusion of the speech of the Genii Universales, whose triple internal rhymes and opulence of assonance and alliteration comport excellently with the supernatural speakers, and half disguise the pessimism that they express.

> "I grieve as I go, Forsooth for I know The travail and woe untold,
> The wrack and the war, The stressfulness sore, That the future in store doth hold,
> The horror of hate 'Twixt the small and the great, In the scriptures of Fate enscrolled,
> The dearth and the death, The sorrow and scaith, That the forthcoming faith enfold,
> The frost that shall fall On the hut and the hall, On great and on small, young and old.
> The bale that shall brood On the ill and the good, On weald and on wood and on wold,
> When the breeze shall be bare Of the sylphs of of the air Nor the elves shall set share in the mould,
> When the Dryad the brake And the Naiad the lake And the Faun shall forsake the fold,
> When the smile from the sea And the laugh from the lea And the green from the tree shall be polled,
> When, for sorrowful thought, Men rejoice not in aught And all shall be bought and sold.
> And well I know, well, That the spirits, in hell And in heaven that dwell, shall behold
> The dawn of the day When the folk, for dismay Of their summerless way, heavy-souled,
> Shall, dumb in their doom, In their lives without bloom Look back from their gloom and their cold,
> From the blood-boltered maze Of their faiths and their frays, And sigh for the days of old,
> When the Gods debonair, The frank and the fair, Yet governed the age of gold."

The remaining volumes of the long row which represents the spring season's output of verse include none of sufficiently fine or individual poetic quality to call for more than passing mention. Mr. John Lewis March's 'Book of Verse' (Badger), Miss Mary Ainge de Vere's 'The Wind-swept Wheat' (Badger), and Miss Ruth Young's 'Verses' (Longmans) all show a sincere though slender inspiration, and the faculty of correct and graceful versification without distinction. "In Fifty Years,' by Madam Belloc (Sands), a new edition of 'The Saga of the Oak,' by William H. Venable (Dodd, Mead & Co.), and 'A Sunset Idyl,' by Eben Jenks Loomis (The Riverside Press), with less of tunefulness than the three just mentioned, are more thoughtful and filled with a riper sentiment. Mr. Loomis's volume in particular, with its transcendentalism and mild Wordsworthian fluency, is pleasant reading. Mr. Charles G. Kendall's English version of Julius Wolff's 'Tannhäuser' (Badger) is a commonplace and generally infelicitous specimen of verse translation, filling two stout volumes. It is likely to prove of a certain homely service to students of the legend; but such should not waste time in a search for Gaget's 'Livre des Grandes Merveilles d'Amour,' to which Mr. Kendall easily refers his reader for further information. As we have had occasion to point out before, "Gaget's" book has no more substantial existence (outside the brain of Mr. Swinburne) than the tracts of Dr. Primrose. 'The Ballads of Bourbonnais,' by Wallace Bruce Amsbary (Indianapolis: Bobbs-Merrill) has a certain dialectic interest, and the 'Poems' of Andrew Edward Watrous (Lippincott) have at times an unction that makes them readable. 'Frog Hollow Post Bag' by Henry D. Muir, 'Poems' by Pauline Frances Camp, 'Friends Hither and Yon' by L. F. S. Barnard, 'The Radiant Road' by Ethelwyn Wetherald, 'Songs of a Deeper Note' by Edmund Corliss Sherburne, 'Echoes from the Home of Halleck' by S. Ward Loper, 'Poem Pictures' by Laura Case Downing, 'Far from the Stone Streets' by Henry and Helen Chadwick, 'The Rose of Seville' by Elizabeth Minot, and 'Quarry Slaves' by Lee Byrne, all published in Boston by Badger, show poetic ambition.

EIGHT NOVELS.

The Silent Places. By Stewart Edward White. McClure, Phillips & Co.

The Grafters. By Francis Lynde. Indianapolis: The Bobbs-Merrill Co.

The Merry Anne. By Samuel Merwin. The Macmillan Co.

A Little Union Scout. By Joel Chandler Harris. McClure, Phillips & Co.

Later Adventures of Wee Macgreegor. By J. J. Bell. Harper & Brothers.

The Faith of Men. By Jack London. Macmillan.

The Colonel. By the late Capt. Olivieri Sangiacomo. Translated by E. Spender. London: David Nutt.

The Island Pharisees. By John Galsworthy. Putnams.

Few of the story-tellers who go to the uttermost ends of the earth for treasure fare so well as Mr. Stewart White in 'The Silent Places' of the North. His tale opens with a picturesque description of Conjuror's House, a post of the Hudson's Bay Company, where the situation is promptly disclosed. An Obijway named Jingoss having failed to turn up at the post with furs representing the amount of his annual "debt," the factor, Galen Albret, feels that, for the sake of the moral effect on the company's host of vagrant debtors, Jingoss must be sought out, captured, and brought before him for punishment. For this difficult task he selects an old and tried woodsman, Sam Bolton, and a youth, Dick Herron, whose spurs are still to win. After explaining the errand and announcing the reward for success, he adds autocratically, as becomes one of those despots whose word makes law and who used to hold in their hands the power of life or death: "I want no doubt. If you accept this, you must not fail. Either you must come back with that Indian, or you must not come back at all. I won't accept any excuse for failure. I won't accept any failure. It does not matter if it takes ten years. *I want that man.*"

Thus admonished, the men set forth, to be presently joined by an Ojibway girl

resolute to attach herself to Herron, who as resolutely repulses her. But unobtrusive, watchful, and supremely useful, this Ruth of the Ojibway nation follows by trail and stream through the summer weather. When a long winter chase of the erring Jingoss is decided on, in language scarcely less poetical than that of her Jewish prototype she declares her intention to follow faithfully, even unto death. "You'll have a lot of trouble dragging a squaw all over the North," said Herron, throwing the responsibility on the older man, and Bolton hesitated and argued with the "Little Sister." Respectfully listening, she packed her snowshoes and blankets on the sledge. There was a flame in her heart that challenged the frozen North. No man could control her destiny.

So far the interest lies chiefly in physical adventure and in descriptions of progress through a wilderness that in its most favoring aspect lends little aid or comfort to the enterprise of man. As winter's icy breath blows over land and water the interest becomes subjective, and we are involved in a conflict between man's will to persist and conquer, and the passive, inexorable hostility of nature. For weeks the tiny sledge train slips over deserts of snow, Jingoss leading the way, and the keen-nosed hound, Mack, sniffing his trail. The heavy forests are passed; the low spruce and pointed firs fall behind; and so the train winds on into "the vast whiteness of the true north, where the trees are Lilliputian and the spaces gigantic beyond the measures of the earth; where living things dwindle to the significance of black specks, and the aurora crackles and shoots and spreads and threatens like a great inimical and magnificent spirit." At last Bolton knows that Jingoss is heading for the Barren Grounds, where there is no shelter and but one chance for food—that of meeting a single cariboo herd said to drift to and fro on the rim of the world. Yet they have no thought of turning back. Gradually they lost sight of the ultimate "object of their quest; it became absorbed by the immediate object, and that was following the trail." The day came when Bolton lay down on the sledge, whispering that he could live there several days, and urging Herron to push on, trusting himself to Mack's instinct. For two days more Herron follows the trail, and Little Sister (also the victim of mania) follows him. On the third day she fell, and Herron let her lie. Then, glad to be free, with a sense of elation of victory near at hand, he shot away from her. As his excitement passes, he becomes conscious of loss, of missing something he has long been used to. Terror clutches his heart, and when he realizes that the awful silence is unbroken, that there is no longer the *crunch, crunch* of following snowshoes, that he is all alone, without hesitation or a thought of the trail, he turns back.

As Herron waits for death with the dead girl in his arms, all baffled and battered, he passes from brutal boyhood into manhood. His eyes are opened to look upon life, and his heart understands. Here is the climax of the drama, thrilling enough to be called a supreme moment. It leaves us indifferent to the coming of Jingoss and cold to the sight of the cariboo herd, "drifting dim and ghostly, rank after rank, across the middle distance." The real strength of the tale is its spiritual significance, and that interpretation of the spirit of the wilderness which inevitably recalls by contrast the work of Mr. Joseph Conrad. Nature in the Silent Places of the North seems to strengthen and spiritualize men, whereas in the tropical forest, seething with life, she depresses and degrades. Mr. White cannot, like Mr. Conrad, intensify impression by an overwhelming rush of words. He is a little stiff, not guiltless of phrases that have more sound than sense, and shows signs of conscious struggle, sometimes of conscious failure, to say all he feels. Such defects are, however, superficial, and do not either conceal or seriously impair intrinsic worth. There can be no doubt that 'The Silent Places' is a contribution to imaginative literature.

Language, like most things in America, grows fast, but one cannot be so sure that it develops towards perfection. A year or two ago, a book called 'The Grafters' must have suggested persons employed in the growing of roses or in arboriculture—savory and pleasant occupations. To-day this is not the case. "Grafters" appears to have supplanted "boodlers," a word as ugly as the thing it represents, and to our mind more suggestive of persons engaged in picking and stealing on a large scale. The grafters, of whose grafting Mr. Lynde gives an involved but sufficiently horrifying account, comprise the executive of a Western State, a judge, a working majority of the Senate and House of Assembly, and a number of inferior persons spoken of as "troughsmen." These used to be called "henchmen," then "heelers," but the newer word may be accepted without cavil; it conveys all its meaning instantly to the dullest intelligence. These grafters are the most shameless ruffians to whom public attention has been invited. By comparison Mr. Steffens's serious revelations of political corruption pale, and a rather shocking group described in the novel entitled 'The Thirteenth District' become innocent as lambs and white as snow. Bucks, the Governor of the State, Meigs, the Attorney-General, and MacFarlane, the judge, are exhibited in the act of destroying the Trans-Western Railway for their own profit, not actually lifting rails and blowing up trains, but, by complicated methods (all criminal) taking it away from the people to whom it belongs. We do not pretend to understand their machinations, or those of Mr. Kent, counsel for the railway and hero of the tale; but presumably there are people in the West who can follow the plot intelligently, and who will not be disturbed by the rush of the "flyers" and "motors" on which the plotters habitually travel, or by the "wiring" and "phoning" incidental to the conduct of their nefarious business. In the end, owing to the astuteness of Kent, the high moral view of his sweetheart from Boston, and the wisdom of his Egeria, Miss Van Brock, all working together to a fine issue, the grafters are overcome and the Trans-Western shareholders, out of pure gratitude, make Mr. Kent a present of a large fortune. At least, we assume this explanation of his acquisition of a fortune, feeling certain that he came by it honestly, not because he ever strikes us as beyond temptation, but because the Boston girl had plainly let him know that she would have nothing whatever to do either with head "grafters" or "troughsmen."

The moral of the tale is unimpeachable, and to every voice crying in the wilderness let us give a willing and respectful ear. Still, to return to the unimportant matter of language (unimportant, that is, in comparison with national repute), we must protest (perhaps unadvisedly) against much of that in which this particular cry is uttered. We are puzzled to know on what principle Mr. Lynde selects some phrases. Why, for instance, is it better to say, "Loring oriented himself in a leisurely eye-sweep," than that Loring took his bearings in a moment, or in the twinkling of an eye? Of course, our interpretation of Mr. Lynde's phrase may be incorrect. What did Mr. Ormsby do to Elinor when he is said to have kept her "judiciously marooned" in a sleeping car, surrounded by relatives and fellow-citizens? Why does Kent implore an irritated editor to "keep his clothes on"? Is it the habit of excited Western editors to strip and rend their garments, like the prophets of old? Why does every one, hastily pursuing an object, "leg for it," and every one who is tired "get brain fag"? What do "panic-acidulous" and "panic-ardor," and a score more of the hyphenated words profusely scattered through the book, mean? How can an "occult prompting" "see to it" that a thing be done, and by what occult influence was Mr. Lynde prompted to describe the sudden stopping of a train as a "solution of continuity"? We hardly hope to like that phrase better when we have seen it oftener. A legion of novelists looms on the Western horizon; we cannot escape them even if we would. We are willing to submit to being driven hither and yon on their "flyers and motors"; we accept the racket of their "wiring and phoning," but in return ask for some concessions. They may in the end extort from us the sacrifice of our mother tongue, but let them use a giant's power mercifully, and remember that it is not sportsmanlike to hit a fellow when he is down.

Mr. Merwin appears to have appropriated for his use in fiction Lake Michigan and the industries pursued on its surface and shores. Traders who sail their own craft, fishermen, life-saving crews, smugglers, and revenue officers are drawn by him with an assurance that testifies to his acquaintance with both the men and their business. His people generally speak the speech of the illiterate, using local idiom sparingly, and in narration the author approaches more closely to English sanctified by literature and custom than do his contemporaries who dwell more remote from the Atlantic seashore. The subject of the *Merry Anne* is the pursuit and capture by revenue officers of a gang of unlawful distillers of whiskey, who smuggle their product from Canada into the United States. The subject does not seem to us enchanting, but it is very well managed, and no doubt many people like stories of rough adventure conducted by roughish men. The captain of the *Merry Anne* is a good fellow, who comes out of serious complications with flying colors. It is pleasant to think of him defeating the revenue officer in love, and gallantly sailing away in the *Merry Anne*, with his girl doing her trick at the wheel.

Scouting during the civil war appears to have been easier work than it was in South Africa, or is now in Mantchuria. According to writers of fiction, much of the scout-

ing for North and South was done by girls, dressed up as boys, to be sure, but, from all reliable accounts, more obviously girls than if they had stuck to petticoats. 'The Little Union Scout' of Mr. Harris's tale had already made fame as Capt. Frank Leroy before the adventures here narrated befell. Her proper name was Jane Ryder —such a sensible-sounding name that one can hardly think of its owner so foolishly masquerading. Undoubtedly the combatants knew Capt. Leroy for a girl and permitted her to prance between them, for the sake of distraction from the grimmer affairs of war. Her tale is told with Mr. Harris's accustomed ease, and shows, as do so many of his tales, his familiarity with details of the war and with the feeling on both sides.

Persons who delighted in the first volume of "Wee Macgreegor's" adventures can probably endure the second. The Robinsons, Purdies, M'Ostriches, reappear, natural as ever, but not in situations to reveal character more fully. Macgreegor continues to ask pointed questions and make inopportune comment, to be amusing as clever spoiled children sometimes are—at long range. A useful glossary, indispensable indeed, for those unfamiliar with the speech of common Glasgow folk, is included in the volume.

Of the eight stories in Jack London's 'Faith of Men,' four profess to be amusing and at least partially succeed, though the laughter induced is of the kind familiarly described as on the wrong side of the mouth. The other four simply vie with one another in unpleasantness. The man who, after untold hardships, transports a thousand dozen eggs to Dawson City, only to find them rotten, is hardly more repellent in his suicide than in his previous tragedies. The man who marries from pique under a misapprehension rouses in us irritation rather than pity, and the last story of all is an unsatisfactory compound of "Zaza" and Kipling's "Georgie Porgie." But the palm in sordid grewsomeness must be awarded to the dog who hangs his master, grotesque and unworthy successor of the author's fascinating Buck. It seems regrettable that Jack London should employ his wide knowledge, keen insight, vivid powers of description, and trenchant vocabulary merely in order to make us plough through miles and miles of ice and snow, in the company of unscrupulous men whose fun is to make Indians drunk, and whose earnest is to deceive and kill, of women devoid of moral sense, and of dogs whose brutal savagery would put wolves to the blush.

'The Colonel' is another powerful and unpleasant book, but in this case the whole tone is high, and the moral lesson obvious, though not obtruded. Its motto might well have been the terrible truth expressed in the sanction of the second commandment. The illegitimate son of an Italian colonel commits murder in his regiment, and is sentenced to death by his own father, who dies of the shock. The descriptions of Italian military life come from the practised pen of one having authority, and if they differ widely in spirit from the pictures of De Amicis, allowance must be made for personal points of view. The book is a translation, and higher praise cannot be given to E. Spender than to say that, except in a few isolated sentences, we remain unconscious of the fact.

'The Island Pharisees' is characterized on the paper cover as an "enterprising novel" with a "light and readable style." This may be the publisher's sincere conviction. The reader would probably describe it as a lengthy diatribe against what the author calls Conventions and most people call Morality, without any plot to speak of, and with an abundance of cheap cynicism, labored epigram, and unconvincing psychology. Why the French tramp with a "long, thin, lopsided nose" and "goggling, prominent eyes," enunciating trite satire against society, should have so far influenced the hero as to make him break off his engagement, we may well wonder. But we cannot but feel that Antonia is well rid of a lover perpetually in opposition to the powers and things that be, and yet too languid to seek out a remedy—a man whose ideal is to "understand things and let them slide." The author, in the person of his hero, is facetiously sarcastic over the lack of true Christianity in marriage, class distinctions, patriotism, organized philanthropy, police regulations, and so forth; but, unfortunately, his criticism is purely destructive, and he has no new hope nor aim nor motive to give us, and no new course of action to suggest. Limited and Pharisaical as his English gentlefolks may appear, they have to the unsophisticated reader the advantage of at least some principle and moral standard; but, to the writer, principle and moral standard seem to be a *bête noire*. The book might fitly be called 'The Island Pharisees, by a Sadducee.' "For the Sadducees say that there is no resurrection, neither angel nor spirit; but the Pharisees confess both."

The History of the Nineteenth Century in Caricature. By Arthur Bartlett Maurice and Frederic Taber Cooper. Profusely illustrated. Dodd, Mead & Co. 1904.

Neither the historical nor the literary sense distinguishes this compilation, which belongs in a peculiarly difficult class. The choice lies between a frank exhibit of a definite number of pictorial examples in orderly arrangement, with the necessary elucidation, and an essay with illustrations thrown in. In the latter case the temptation is irresistible to describe pictures not reproduced, or not available for reproduction; and no literary skill can make this readable. Mr. James Parton, whose 'Caricature and Other Comic Art' appeared in 1877, but is not, we believe, referred to in the present work, was a practised writer taking broad views, and succeeded as well as any one is likely to in weaving an interesting text about his collection of designs. His successors both cover a narrower tract and work it less deftly and comprehensively. Parton's twenty-second chapter was devoted to Italian caricature, and Italy certainly cuts some figure in the history of the past century, but her comic artists get the barest recognition here. German caricature is feebly and casually represented: it is not drawn upon for the Franco-Prussian war, which is illustrated wholly from the side of the vanquished (with a couple of Tenniels). The Dutch creeps in by way of the Boer war, as Spanish caricature by way of 1898. French, English, and American art forms the staple.

Our authors' general reflections on caricature are jejune, and as respects American undiscriminating. *Puck* and *Judge* are credited with "a formidable power," which perhaps they have, but the decline of *Puck* upon the death of Keppler and Bunner is not adverted to; and very naturally, as there is mention without reprobation of artists serving indifferently and simultaneously two opposing parties. This was not Keppler's humor, nor was it Nast's. Our authors notice, almost incidentally, "the fact that a majority of the ablest caricaturists of today are devoting their talents to the daily press." "It is an exacting sort of work," they add; "exhaustive both physically and mentally." They might further have alleged, morally.

Some artistic comparison of caricature in the several countries might have been expected; or in successive epochs in the same country. The relation of war to caricature by way of both stimulus and debasement was a theme fairly suggested by the instances furnished by the Spanish-American conflict—on both sides. Parton had a different vision in his preface.

"I am sometimes sanguine enough to think," he says, "that the pencil of the satirist will at last render war impossible, by bringing vividly home to all genial minds the ludicrous absurdity of such a method of arriving at truth. Fancy two armies 'in presence.' By some process, yet to be developed, the Nast of the next generation, if not the admirable Nast of this, projects upon the sky, in the sight of the belligerent forces, a *picture* exhibiting the enormous comicality of their attitude and purpose. They all see the point, and both armies break up in laughter, and come together roaring over the joke."

The Hague seems a solider assurance. Were it a case of wager of battle with magic-lantern caricature for weapons, the Japanese might be thought as capable antagonists in this field as in that of arms.

To sum up, this 'History' can be recommended almost entirely for its selections from the enormous mass of pictorial material, with omissions as grave as Doré's 'La Sainte Russie' in the chapter on the Crimean war. The text is jumbled. There is no index. The paper is over-glossy and over-weighted.

Early Reviews of English Poets. Edited, with an introduction, by John Louis Haney, Ph.D. Philadelphia: The Egerton Press. 1904.

It was a happy thought, that of collecting in one handy volume these selected and important reviews, embracing a period of almost exactly a hundred years, from Goldsmith's tempered praise of Gray's odes (1757) to the *Saturday Review's* proclamation in 1855 that "this sort of thing [Browning's poetry] should be stopped"—so that the scope of the work is nearly co-extensive with the revival and triumph of what is called (for want of a better name) "Romanticism."

It is not merely as a convenience to the student, who can have here under his hand important documents not otherwise readily accessible, that we welcome this volume, but as comprising an instructive and significant chapter in English literature. If the poems here reviewed represent the tendencies of the age, these criticisms represent for us the mental environment into which those tendencies were emerging, and which they were gradually to transform. We have here the natural resistance of the soil to the germination of the seed—

the inevitable protest of the old bottles against the new wine—in all its forms, from the Olympian superiority of the *Edinburgh*, and the tearful expostulation with an erring brother of the *Christian Observer*, to the Ashantee war dance of *Blackwood*. Every reviewer regarded himself as a judge, and the author as the prisoner at the bar; and every review was a sentence. Could they but have brought themselves to see that critic and poet were but fellow-worms, and the poem and the review alike crossing ripples of the same current—but that was not possible.

When we are irritated by the dogmatism, the superciliousness, the lack of "sweetness and light" in these reviewers, we run the risk of falling into their error. Most of their censures rest on justifiable grounds. It is quite true that much of Wordsworth's work is dull, and much childish; that Coleridge wrote melodious nonsense; that 'Endymion' is crude and cloying, and Byron affected and melodramatic. But what these critics failed to see was that all these phenomena were connected and significant—were symptoms or premonitions of a coming transformation. Just so Ben Jonson, with perfect justice from his point of view, thought it monstrous that an infant should be born in the second act of a play and appear full-grown in the fourth. Measured by the Greek standard, so it was; but he failed to see that the drama was widening its scope from the Incident to the Tale.

The day of the judicial review is past, or, as the *Saturday Review* puts it, in finer language than we can command, "the correctional justice of criticism has abdicated its proper functions." "Interpretative criticism" is now the order of the day. And here arises the thought, when interpretative criticism in its turn is outgrown, what is to come next? Will there be a world in which all writers are so lucid and all readers so perspicacious that there will be no room for interpretation, and the review will have sunk to the book-notice?

The present work is complemented by excellent notes, and an introduction containing an interesting historical sketch of the English critical journals.

Working with the Hands. Booker T. Washington. Doubleday, Page & Co. 1904.

While this volume of Mr. Washington's necessarily contains some repetitions of ideas given in his previous works, they are such as will bear being brought once, twice, and many times before the public. Some of his teachings we could wish applied to all races, *e. g.*, "I have taught our girls from the beginning of this school that a student who receives pay for properly attending to dishes, and does her work poorly, is guilty of two wrongs: She is guilty of falsehood, and guilty of receiving money for doing something which she has not done." Would that every worker felt this! Well and tersely put is the difference urged between slave and free labor: "There is a vast difference between working and being worked. Being worked means degradation; working means civilization." Mr. Washington speaks of the comparative numbers of immigrants coming to North and West, and South, and ends with this: "It must be frankly recognized by the people of that section, that for a long period they must depend upon the black man to do for it what the foreigner is doing for the Great West, and that they cannot hope to keep pace with the progress of people in other sections if one-third of the population is ignorant and without skill. If the South does not help the negro up, it is tying itself to a body of death." Most true; but it is not only the people of the South who should "help the negro up"—private help should go from North and West for this end. No part of our country can be left semi-civilized—East, West, North, and South; white, black, and yellow! As a country, the one thing we cannot afford is ignorance.

Most heartily we can commend Mr. Washington's plea for practical results rather than talk—which last is always easy to get:

"One farm bought, one house built, one home neatly kept, one man the largest taxpayer and depositor in the local bank, . . . one office filled, one life cleanly lived, these will tell more in our favor than all the abstract eloquence that can be summoned to plead our cause."

Mr. Washington has tried to find out whether in general the whites find the educated or the ignorant negro most to their minds. For this end he sent out many inquiries. The majority of answers was plainly in favor of educated negro labor. One questions whether Mr. Washington may not be undertaking, in one place, too many trades and too great a variety. There is always danger that spreading too much may result in want of really thorough work. Any one institution may become too big for its own good. We trust that Tuskegee may avoid this danger, and long remain the great hope and training school of the negro race.

NEW NOVELS TO SUIT ALL TASTES

THE BEST NOVEL BASED ON AMERICAN HISTORY IS

Winston Churchill's **The Crossing** *Illustrated in color*

"**Mr. CHURCHILL** has contrived to make his book thoroughly interesting. He paints for us a panorama which embraces all manner of picturesqueness, the cabin of the frontiersman, the stately manor of the aristocrat, the virgin forest and the rapidly growing town. '**The Crossing**' is a workmanlike piece of writing, and for that reason, as well as for the interesting nature of the material used in it, holds the attention of the reader from the first page to the last."—*The New York Tribune.*

THE BEST HISTORICAL ROMANCE IS

Maurice Hewlett's **The Queen's Quair**

"The unfortunate Queen of Scots is not discussed; she simply is made to live before the reader. . . . For the reader who cares actually to read, his work is all but incomparable . . . one of the few books which will survive. For it is literature—genuine literature."—*The World To-day.*

"A breathing, moving record, made to throb with the red blood of life."—*The New York Herald.*

THE MOST FRUITFUL OF DISCUSSION IS

Barbara's *new novel* **The Woman Errant**

The author of "People of the Whirlpool," etc., decidedly a "woman domestic," pictures with incisive touches, but with kindly sympathy "the women errant" who from choice or necessity, goes forth to seek her life work outside her natural home relations.

"It is a very entertaining book . . . extremely good reading."—*N. Y. Times.*

MOST DELIGHTFUL IN OUT-DOOR ATMOSPHERE

Elizabeth's **Adventures in Rügen**

"Even more original, more fascinating than 'Elizabeth and Her German Garden.'"—*New York Times' Sat. Review.*

MOST REPRESENTATIVE OF JAPANESE LIFE

Onoto Watanna's **Daughters of Nijo**

"is a love-story, pure and simple, and through it all drifts all the enchanting, dreamed-of, longed-for beauty and poetry of Japan."
—MRS. ELLA HIGGINSON.

Illustrated by KIYOKICHI SANO.

Each of the above is **$1.50.** *For sale at all bookstores*

THE MOST DELICIOUSLY AMUSING IS

Mrs. Kingsley's **The Singular Miss Smith**

"**Florence Morse Kingsley** is clever without being profound and without trying to be clever—and what more can you say of one whose mission it is to entertain the public with fiction? Sanity is an absolute term, but one likes to think that there are about seven degrees of it, so as to place her most delightful little novel in the seventh."—*Louisville Post.* *Illustrated, $1.25.*

NEW BOOKS AS ENTERTAINING AS ANY FICTION

Mr. MURPHY'S

Problems of the Present South

By EDGAR GARDNER MURPHY

$1.50 net. (*Postage 10c.*)

"Of the innumerable books on the unsettled questions of the South it is the sanest, fairest, most practical and most suggestive."
—*The Boston Transcript.*

Dr. WILCOX'S

The American City: A Problem in Democracy

By DELOS F. WILCOX, Ph.D., Author of "A Study of City Government." *Citizens' Library.*

Cloth, $1.25 net. (*Postage 11c*)

ELSON'S United States

By HENRY W. ELSON

Cloth, $1.75 net. (*Postage 24c.*)

"Mr. Elson has a happy faculty of writing history as he would tell a story."
—*Boston Transcript.*

"We know of no single-volume history that is its equal in style, material, accuracy and arrangement." —*Baltimore Sun.*

Published by **THE MACMILLAN COMPANY,** 66 Fifth Ave., N. Y.

The Nation.

NEW YORK, THURSDAY, JUNE 30, 1904.

The Week.

Mr. Root's speech at Chicago shows how literally he has "resumed the practice of the law." It was skilful, plausible, but essentially an advocate's plea. Intended, of course, as much for circulation in the form of a campaign document as for immediate effect upon his audience, it was a reasoned attempt to persuade the country that Republican rule and Republican policies are for the public good. The absence in it of the note of personal adulation is most grateful. Its entire suppression of Jingoism and the screaming eagle proves that Mr. Root is more sagacious than all the barbaric yawpers. He has nothing to say about the big-policeman theory of our mission. He is not anxious to "police" a single disorderly Government, except our own. Corruption in the Federal services he glides over deftly. The tariff he damns with faint praise, holding out a hope of needed revision—though, of course, only by its "friends." (How can Republicans say that any more without laughing in each other's faces?) Of the Philippines he paints a bright picture, though he admits reluctantly that it may be necessary to acknowledge their independence some day. But neither he nor the party is willing to make any promise to that effect. Mr. Root had a few unguarded moments. For example, he went over bodily to the quantitative theory of money, and discoursed of "per capita" as glibly as any silverite or greenbacker. Whatever may be said of this, it is too obvious a justification of old Democratic contentions, and too plain a hint of the way of escape for the Democratic platform-writers, to have been expected from so astute a special pleader. And was it not a mistake to affirm so roundly that the action of the President in the Panama matter was "in accordance with the law of nations"? This is to remind people that it has been denied; and also to recall the fact that our most eminent expounders of the law of nations have asserted the contrary.

The Republican position is rapidly getting to be that the Democrats cannot be trusted not merely to revise the tariff, but to undertake any part of the administration of Government. Mr. Root laid it down in his speech that they would be "unfriendly guardians" of the Panama Canal, and therefore that no patriot could think without alarm of its being dug under a Democratic President. Presently we shall be told that pensions can be paid out only by the hands of their "friends," the mails sorted by good and true Republicans alone, and "seeds" dispatched to farmer constituents only by those who are "friendly" to vegetation. Such complacency in their own powers has been observed in public men before. It was remarked of one English Ministry that they were fully convinced that they were "the only body of men competent to carry on affairs." Yet that keen politician, Benjamin Disraeli, declared in his Life of Lord George Bentinck that such a conviction on the part of men in high office "is often current on the eve of great changes."

Mr. Root's address before the Yale Law School on Monday will hardly be dedicated, when it is published in full, to President Roosevelt. It would be too much like the humorist's fancy of writing a 'Life of Naboth, with some account of his Vineyard,' and dedicating it to his Majesty King Ahab! For Mr. Root's measured and weighty words on the dangers to the common weal which arise from the ignoring by those in high office of the limitations of their power by law, can have only one personal bearing. If they mean anything, they mean a condemnation of Mr. Roosevelt's tendencies. In a more sober dress, Mr. Root presents the same thought which, clothed in Bourke Cockran's glittering rhetoric, impelled the House of Representatives to frenzied applause—namely, the peril of executive usurpation and the duty of resisting it. It is a needed and courageous utterance which Mr. Root has made. It will carry far and do good—all the more so if it causes the ears of a certain "great officer" to tingle.

Since the dispatch which demanded "Perdicaris alive or Raisuli dead" will be constantly cited on the stump as the heroic act of a President who does things, it may be well to look into the chronology of the events which led up to Mr. Perdicaris's release. It proves that the threat had no effect in Morocco, and was timed not with any view to hastening Mr. Perdicaris's liberation, but rather with the purpose of enlivening the Convention on June 22. Here are the facts: (1) On Tuesday, June 21, the ransom of Perdicaris and Varley had been deposited at Tangier, and it was morally certain that they would be promptly released. (2) On Wednesday, June 22, about 3:30 P. M. the Perdicaris dispatch was read at Chicago. Presumably there had been no delay in its transmission, and at 4:30 (Eastern time) it must have been sent simultaneously to Chicago and Tangier. It could not, allowing for the difference of time, have reached Consul Gummere at Tangier before 9:30 P. M. (3) But by that time it was thoroughly known in Tangier that the go-between, Mulai Hamet, would leave early the next morning, with the ransom, for his sixteen-hours' ride to Raisuli's camp. Now note that the famous dispatch could not have been received before the late evening of the 22d; that Raisuli was sixteen hours, by horseback, away in the mountains; that Mr. Perdicaris, as he told the representative of the Paris *Herald*, knew that the Sultan had granted all Raisuli's demands "three days before the ministers were aware of it at Tangier"; finally, that Raisuli actually brought Perdicaris and Varley to the rendezvous appointed at the time appointed. In other words, when the threat came over, everything was taking its regular course; nobody in Tangier, not even the captives in the mountains, had any reason to suspect that the release would be delayed, much less refused. The chances are that Consul-General Gummere read the telegram, smiled as he remembered it was convention time, and turned over and went to sleep again. This is the true story of what history, if it deigns to signalize the matter at all, will set down as one of Mr. Roosevelt's most characteristic bits of catchpenny bluster.

Gov. La Follette seeks consolation for his snub in the Convention by speaking a shocking amount of truth against the party machine. He tells his Wisconsin constituents that the Republican party is no longer patriotic, but plutocratic; that it is secretly opposed to the President's attempt to control the corporations, and that it is void of principle of any sort. Gov. La Follette adds, to be sure, that he and Mr. Roosevelt share certain anti-Trust convictions which, with the aid of the people, they mean to force upon the party. This, however, is not a campaign argument of the ringing kind. No ingenuous voter will rush to a body which is charged with a desire to knife the candidate it has nominated by acclamation, and for principles can only point to the hope that it may acquire some during the campaign.

If they but knew it, Lodge is the best friend the people of Massachusetts have. His attitude at Chicago towards reciprocity was such as to cover a multitude of previous sins—including his stifling of that issue at the State Convention recently. According to the Boston *Journal's* correspondent, the general sentiment at Chicago was "Reciprocity be damned." He says it was only by Lodge's "grim determination," in the face of the whole resolutions committee, that the "little sop" in favor of reciprocity in "non-competitive articles only" was obtained, and he did not suc-

ceed in getting even this until four o'clock in the morning. So the friends of reciprocity, says the Boston *Record*, are shown that the man they have so bitterly attacked is "the only real friend" they have among the Republicans of note in the whole country. But we are afraid the 35,000 New England petitioners for reciprocity will not view it in that light.

Few realize in what a state of flux President Roosevelt's Cabinet has been. The latest changes merely come upon the heels of many. Mr. Roosevelt lost successively President McKinley's Postmaster-General, Secretary of the Treasury, Secretary of the Navy, Secretary of War, and now Attorney-General. Even his own creation, Secretary Cortelyou, steps out before he has fairly got to work. But the President shuffles the Cabinet about cheerfully, as if it were only a question of changing orderlies. Unfortunately, the impression is given throughout that politics, not efficiency, is the prime consideration. There is Postmaster-General Payne, for example. His health is as badly broken as his prestige. He is the first one whom the President should ask to resign. The Post-Office Department, which, we suppose, is still being investigated "in our own way and at our own time," would be better off without him. Yet he stays on while better men go. The reason is avowed: he is simply to keep the place warm for Mr. Cortelyou till after the election. That all this injures the efficient conduct of the public business is certain. It also tends to degrade the Cabinet itself, and to make its members mere pawns to be moved about at the President's convenience, and purely for political reasons.

In his letter to the retiring Attorney-General, the President says no more than is Mr. Knox's due in paying tribute to his legal ability, skill, and laborious devotion to the work of the Department of Justice. Mr. Roosevelt's superlative habit ran away with him, however, when he ranked Mr. Knox above all the "great and able men" who had preceded him in office. And when the President states that "the development of our entire political system in its relations to the industrial and economical tendencies of the time" has been "deeply affected for good" by the Attorney-General, does he mean to imply that the work is all done, and that no more Trusts are to be "busted"? It would look so, until after election at any rate, since it is announced that Mr. Moody's appointment as the successor of Mr. Knox is only a stop-gap. A man who intends to withdraw from the Cabinet and "practise law" after six months, will not be likely to practise much anti-Trust law while temporarily in the Department of Justice.

If battle-scarred Republican politicians were angered by the President's making a raw recruit like Mr. Cortelyou chairman of the National Committee, what will they say to his placing Mr. Paul Morton in the Cabinet? Here is a man whose Republican wedding-garment is yet confessedly creased with newness. Of Democratic ancestry, himself a Gold Democrat until very recently, his sudden promotion over Republicans who have borne the heat and burden of the day is certain to provoke bitter complaints in the vineyard. But the laborers therein must know that they have a master who proposes to do what he will with his own—his own being the party and the Government. He likes Mr. Morton personally, and doubtless considers it clever politics to bid for support by independent Democrats through an example of the ease with which they may obtain office by the simple process of becoming Roosevelt Republicans.

We trust that the first thing Mr. Cortelyou does as chairman of the National Republican Committee will be to stop the publication of indiscreet information by the Bureau of Statistics. Take the figures just issued regarding our trade with Japan. The facts confound all the theories of the friends of protection. The figures show that our exports to the Mikado's empire amounted to $22,594,713 during the past eleven months, against $19,854,843 last year; but they also show that in the fiscal year 1900 the exports amounted to $29,087,475, whereas, on June 30, 1904, they will probably not exceed $24,000,000. The significant fact is that this falling off marks a blow at a great American industry. For the first eleven months of 1900 Japan imported 161,500,000 pounds of American cotton at a cost of $12,666,666, but for the same period this year she took less than 24,000,000 pounds, valued under $3,000,000. Owing to prosperity prices under a Republican Administration, Japan has been obliged to buy her cotton of India, and with it has become an increasing competitor of ours in the China market for cotton goods. Last year she was the only nation to make increased sales there.

But this is not half the story. While out total exports to Japan for the eleven months were $22,594,713, our imports were $44,367,461. Certainly, our experience with Japan gives the lie to the champions of protection. And there is more than appears on the surface, for many of the things which make up Japan's "balance of trade" against us are articles which are displacing similar American products. An excess of imports compounded in this way should be kept out of sight in a Presidential year. The figures just given out by the Bureau of Statistics show very clearly that the heavy imports of Japanese gold at San Francisco in the last few months could not have been for American account. They money was unquestionably for Europe. The fact is, Great Britain manages to sell Japan more than she buys from her, and is thus able to provide us exchange on Tokio. We hope our campaign orators will ignore that fact on the stump this year; and the chief of the Bureau of Statistics should also be given the hint.

At the dinner recently given by Gov. Bates of Massachusetts to the Filipino Commissioners some influence—perhaps of the place—had an exhilarating effect upon our friends from far away, for they unloosed their tongues to an extent which must have caused Secretary Taft to grieve profoundly. It is barely possible, however, that they may have been incited by the speech of Mayor Collins of Boston. According to one newspaper account, he told "the recently pacified gentlemen from the Philippines" that "there was a God in Israel." Let the Filipinos, he said, "take back the example of Lexington and Bunker Hill, and may the spirit which was exhibited there inspire the 8,000,000 of these islands." No wonder that one visitor after another rose up and vehemently asserted that the American Government ought formally to declare its intention to grant the Philippines complete independence. One of the speakers asserted that, though the islands were able to throw off the yoke of Spain, they wished to secure "by friendly means" their independence from the United States." Clearly, it was a mistake to let the visiting Filipinos set foot upon New England soil.

It is possible that the introduction of sixty-four new typesetting machines into the Government Printing-Office this summer may work a radical reform in the American theory of government. According to the *Tribune's* Washington correspondent, the five hundred extra hand compositors who are employed during the sessions of Congress will not be needed, and, beginning with the coming session, will not be hired. But can it be possible that the Administration has any intention of making the Public Printer conduct his business as cheaply and as efficiently as a private establishment? Suppose this rule were applied to all the departments. What a cry would go up all over the land if the supernumeraries in our custom-houses and post-offices were given their walking tickets! "Extras" are one of the ends for which government has existed in the past, and it is certainly strange for the Administration to choose this particular time to start a movement for business-like economy. Of course such a departure will win a certain amount of applause, but is

this not likely to be heavily outweighed by the disgust of organized labor and of our statesmen? The latter will have five hundred fewer snug berths for the "boys" of their districts.

After three months of the new "Jim Crow" street-car regulations in Richmond, Va., the boycott by the influential negroes has been effective enough to result in one change of the rules. On the rear seats of the open cars, smokers of both races are permitted to mingle, and as yet the social system of Richmond has not been destroyed. The only arrest attempted thus far among the colored patrons was of a mail carrier who, an officious conductor believed, was occupying a forbidden seat. As it turned out, however, the seat was one open to negroes, and the conductor was discharged for interfering with a United States mail carrier. The negroes are using the most effective method to convince the street railway company that its rules are ridiculous—they are walking whenever possible. The company's prediction that three months of walking would bring the colored people back to the "Jim Crow" sections has failed signally of fulfilment, and it is predicted that other modifications of the obnoxious rules will soon be made.

Taking advantage of Policeman Roosevelt's preoccupation, the bad boys in Port-au-Prince have been stoning the French and German Ministers. This will worry police headquarters in Washington. It had been hoped there that, while Policeman Roosevelt was doing duty at the polls in the United States, order might be preserved elsewhere on his large beat. But France and Germany have had to take the law into their own hands in Hayti and have got their apology unaided. The chances are that any other troubles between now and November in South and Central American alleys will be adjusted in the same offensive fashion, to the imminent danger of the Monroe Doctrine. Under the circumstances, any less active guardian of the peace than the White House *gendarme* would complain that his beat is too large. Not so, however, with the Constable of the Continent. He is but temporarily doing election duty, and we warn those roystering fellows to the south of us to crowd all their fun into the next four months.

For sustained interest a tariff war is preferable to a military contest. The longest military fracas is over in a comparatively short time, and the acute suffering occasioned by it is soon forgotten. But tariff animosities perpetuate themselves decade after decade. This fact is illustrated by the report of the committee appointed by the French Parliament to investigate the tariff relations of the republic with outside nations. It declares that "Germany has forged against her neighbors, against her industrial competitors, a formidable weapon, capable of profoundly troubling the economic relations that exist between them." But can a nation "profoundly trouble" its neighbors without itself being adversely affected? The committee points out the "exceedingly remarkable results" achieved by German agriculture within the last ten years, but it also says that, in looking over the last three years, this growth seems to have reached its maximum. In view of the continued low prices for farm products and the high price of labor in Germany, "the farming community is quite discouraged." What a strange conjunction!—a high tariff and low prices for its beneficiaries. And how singular, too, that "Germany is every year obliged to look abroad for her cereals." But strangest of all is the fact that, though France pretends to have been "profoundly troubled" by the tariff aggressions of her neighbors, she always has more ready cash to lend than any other nation.

As regards tariff retaliation, the race is not always to the swift, nor the battle to the strong. Germany has made this discovery, and as we are a big nation and are talking rather loudly of discriminating duties, it may do us no harm to note the outcome of the game she has been playing with Canada. When, in 1898, the Dominion granted the mother country a tariff preference of 33 1-3 per cent., Germany claimed an equal privilege under an existing treaty with Great Britain. The latter overcome the difficulty by denouncing the treaty. This led to the imposition by Germany of maximum rates on Canadian goods; and the end of it all was that Canada, in 1903, put a sur-tax on the products of the Kaiser's subjects. Would any one have supposed that the 5,000,000 people of the Dominion could defeat the 56,000,000 of the Empire in a tariff fight? Yet it appears, from Canadian official reports, that for the nine months ended March 31, 1904, our northern neighbor imported only 530,000 pounds of raw sugar from Germany, against 150,000,000 pounds the previous year, the business being shifted to British Guiana and the British West Indies. It would seem that playing with retaliation is like playing with lightning—it is impossible to predict where the bolt is going to strike.

Since Togo's latest torpedo dash, which resulted in the sinking of a battleship of the *Peresviet* type and the disabling of the *Sevastopol*, the Port Arthur squadron is reduced to four battleships, all badly damaged, and a miscellaneous assortment of lighter vessels, of which the cruiser *Bayan* is the only formidable fighting machine. A small part of Togo's fleet can now maintain the blockade easily, while the rest may reinforce Kamimura in the Straits of Korea or escort an expedition to Yinkow. Incidentally, the appearance of the Russian squadron in the outer roadstead shows that the harbor channel has either never been blocked or has subsequently been cleared; but probably the blocking tactics, aside from their demoralizing effect, have prevented free egress from the harbor and pocketed the Russian fleet for long periods.

Two rather significant movements emerge from the ruck of Far Eastern dispatches. An advance has been made from Siu-yen to the pass of Feng-shuiling on the direct road to Kaiping. A little earlier, Oku, below Kaiping, had detached a column towards the right to join the force advancing by the southern road between Siu-yen and Kaiping. By this time the juncture must be effected, and the three Japanese columns bearing on the Kaiping-Ta-che-Kiau line must be in touch at not more than twenty miles distance from Kuropatkin's right wing. What he has to fear is a simultaneous attack from the south (Kaiping) and at Ta-che-Kiau (the junction for Niu-Chwang). Tactically, his position seems weak. His flank appears to be already turned, the Japanese columns moving upon him from the east are operating in mountainous country highly favorable for concealment, and it will be very difficult for him to foresee just whence the blow against his line of communications will be struck.

Forty miles to the north a remote but formidable danger impends. The Japanese, by a clever flanking movement from the south, have taken the famous pass of Mo-tien-ling on the post road between Feng-Wang-Cheng and Liaoyang. This places them in a very strong position within twenty-five miles of Kuropatkin's old headquarters. In case of a serious reverse to the south, a small force from this point of 'vantage could easily turn a retreat into a *débâcle*. Obviously, Kuroki has taken considerable risk in throwing out a brigade more than forty miles from his main line of advance, and has counted confidently upon the immobility of the Russians. Probably such a movement indicates also that Kuropatkin's effective force is still inferior to that of the united Japanese armies. The seizing of Mo-tien-ling, even if it should be in the nature of a feint, will probably detain at Liaoyang many regiments which would otherwise go to reinforce Kuropatkin. The Japanese net is being drawn inexorably about his southern positions. The news we have indicates that he is massing his forces near Kaiping, where the greatest battle since the Turko-Russian war may soon be fought.

THE NOMINATION.

It has been very easy to nominate Theodore Roosevelt; it will be more difficult to elect him. He was the inevitable candidate of his party, though many of its leaders dislike him and many of its rank and file distrust him; but he is not the inevitable candidate of American voters with the alternative of a trustworthy Democrat. From now on begins the process of persuasion, and what have the Republicans to offer but the magic name of Roosevelt? The party cries ring hollow: prosperity-compelling protection meets the fact of business depression; anti-Trust oratory would leave a vacuum in the campaign chest; shipping subsidies cannot be advocated in the face of a depleted treasury; sound currency is a non-contentious issue; even on the subject of Imperialism, no one longer seriously urges Mr. Roosevelt's "the-flag-will-stay-put" argument. We doubt if any Republican campaign committee has faced a contest with so little partisan ammunition in reserve. Charges of panic and disloyalty upon the Democrats are worn out. What remains is simply the glamour that surrounds the personality and the deeds of the candidate.

Whoever doubts that Mr. Roosevelt is the sole Republican issue has only to remark the last two days of the Chicago Convention. What changed the apathy that greeted Mr. Root's weighty chronicle of Republican successes into the tremendous enthusiasm that followed the braggadocio concerning Raisuli, Gov. Black's flamboyant portrait of a stern, unterrified war chief, and Mr. McKnight's florid visions of the commercial conquest of the world? Why, simply the introduction of Mr. Roosevelt in his heroic—we may say, his legendary—aspect. It was this that moved gagged and bound delegates to enthusiasm; it is in this sign that the Republican party will conquer next November, if conquer it can. But it is a terrible thing to be legendary before you are dead. Few statesmen have had Disraeli's luck to keep even pace with the popular belief in them, and no statesman who ever so little disappoints a people habituated to scan him in heroic dimensions, is forgiven. Witness the most instructive instance of Admiral Dewey.

The triumph of Mr. Roosevelt, then, depends largely upon his ability to seem for the next four months as lovable, picturesque, incalculable, sensational, heroic, as he has appeared for the past seven years. It is a task to appall any one but Theodore Roosevelt; it may well transcend even his histrionic powers, hampered as he is by the Presidential office, for your professional hero is terribly in danger of repeating himself, and even more in peril of taking the fatal step from the sublime to the ridiculous. And Mr. Roosevelt is driven towards an awkward dilemma. Could he carry on his continuous heroic performance at a pressure which would but just content the strenuous West, he would take the risk of scaring the effete East into the arms of any reasonably restful Democrat. To frighten the East means to sap the golden stream of campaign contributions at its Wall Street fountain-head, and a drought at this point is serious, for even the West will not indefinitely shout itself thirsty at its own expense. Yet we believe that Mr. Roosevelt must confidently cast himself upon his legend. The hypocrisy of posing as a "safe" candidate merely would be as intolerable to him as it would be transparent to all his doubtful supporters. For this campaign he is the party, and the Republicans will find his volatile personality both their strength and their weakness.

Herein lies obviously the opportunity of the Democrats. They may present not only a man, but a programme. Their man cannot possibly rival Mr. Roosevelt in so-called popular qualities: he may, however, have the advantage of presenting himself straightforwardly for what he is worth. He need not divert the energy fairly due to advocacy of his party's principles into incessant self-exploitation or heroic attempts to bolster up a waning legend. As he reveals his personality to his fellow-countrymen, he need not be haunted by the harrowing fear that he is being found out. This is a dread that can never be very far away from Mr. Roosevelt, who must know better than any of us how vulnerable his legend really is. There is also a great advantage for a new candidate of a regenerated Democracy in the fact that everything possible has been said in extolling Mr. Roosevelt's virtues, and the country is possibly just a little bit weary of its strenuous Aristides. It is certain that Mr. Roosevelt will win very few votes between now and November; he may lose many. On Thursday afternoon he touched his maximum strength—a sufficient and overwhelming strength it may be; but his qualities and the position of his party are so well known that, if there is any weakness to-day, that weakness is irreparable. Either Mr. Black's boasting was truth or mere bluster; let the Democrats prove which.

Their hope of beating Roosevelt lies in striking him where he is vulnerable—in his enormous egotism and capacity for swift error; and in attacking his party where it is most open in its stolid adhesion to the selfish interests it has wilfully confused with the American people. The combination of a man of solid parts standing on principle would to many be far more attractive than the spectacle of a man of glamour thundering upon the slippery planks of the present Republican platform. Toward Mr. Roosevelt's future the attitude of thoughtful men is that of the publicist Nefftzer toward Bismarck, then Ambassador at Paris, whom Drouyn de Lhuys, the French Foreign Minister, had declared to be a negligible quantity. "Alas," said Nefftzer, "we shall see that man at work; he is more than dangerous—he is attractive." With all willingness to admit Mr. Roosevelt's attractiveness, there is a considerable dread of seeing the man at work.

THE PLATFORM.

A certain amount of clap-trap must be allowed for in every national platform. Its framers are no more on oath than the authors of lapidary inscriptions. Parties would not be parties if they did not, on dress parade, indulge in more or less humbug and boasting. The Democrats at St. Louis may be trusted to trumpet their own virtues as lustily as the Republicans at Chicago. But there is always a residuum in the official deliverances of a party, by which its main attitude may be determined, its hopes and fears inferred, its future policy predicted. Judging in this way the latest Republican platform, we can only say that its chief planks are an extraordinary compound of timidity and shuffling, designed to catch everything while promising nothing, and are in glaring contrast with both the character and the record of the candidate.

For cool mendacity commend us to this statement of the platform-makers at Chicago: "A Democratic tariff has always been followed by business adversity; a Republican by business prosperity." This is to affirm that the panics of 1873, 1884, and 1893 all took place under Democratic tariffs. The truth is that they all took place under Republican tariffs. The first and only Democratic tariff during the past half century, the Wilson bill of 1894, was not even introduced until six months after the panic of 1893 set in. The panic of 1893 took place under the McKinley tariff and was one of its direct consequences. The repeal of the sugar duties and the bounty on domestic sugar caused a deficit in the public revenues. This occurred simultaneously with the Sherman Silver act of 1890, which was passed as a log-rolling measure to help the McKinley tariff through the Senate. When the panic of 1893 took place, the Republican politicians did not ascribe it to a Democratic tariff. They said that it was caused by a fear that there would be a Democratic tariff. They ignored the McKinley tariff and the Sherman Silver bill, which were existing facts of their own devising (facts quite sufficient to account for the mischief), and charged it all to the election of Cleveland—not to anything that Cleveland had done, but what they expected he would do. The Wilson tariff, which came a year and a half later, maimed and perverted as it was, repaired in part the unhappy consequences of the Republican "deal" with the silverites

in 1890. It restored the sugar duties and repealed the sugar bounties, and Mr. Cleveland caused the repeal of the Sherman act; but the mischief that had been done could not be undone in a moment. The panic of 1893 unsettled business too profoundly for instant readjustment. Time was required for healing the disorders caused by the Republican political game of 1890. Instead of saying as before that it was due to expectation of a Democratic tariff, the Republicans now ask the public to believe that the panic took place under the operation of a Democratic tariff.

Next let it be borne in mind that President Roosevelt is on record, in his Life of Benton, as a convinced free-trader. If that be dismissed as a youthful folly, knocked out of him by the necessity of getting office at the hands of protectionists, recall his public speeches as President in 1902. In them he argued openly for tariff revision, and specifically committed himself to the proposition that every duty sheltering a monopoly should be, "of course," abolished. Furthermore, his friendly biographer informs the public that one of Mr. Roosevelt's ardent ambitions is to do away with tariff abuses in his second term; while intimates of the President are taking tariff-reformers aside, in Washington and elsewhere, and assuring them that the true way to accomplish their objects is to reëlect Roosevelt. On top of these well-known facts comes the heathenish prostration of the platform-makers before the tariff fetish!

Thus we have a tariff-revising nominee upon a tariff-worshipping platform, and a bold and forthright candidate standing upon a mixture of trickery and hypocrisy. For no man can read the tariff planks without either indignation at their falsehoods or amusement at their transparent evasions and word-juggling. Talk about words being used to conceal thought—here we have words employed in the attempt to conceal cowardice and cheating. Reciprocity "wherever consistent with protection"! That is, going North so long as you go South. Reciprocity, provided it be "without injury to American agriculture, American labor, or *any* American industry." The force of slipperiness could no further go. Any New England or Western Republican who is fooled by that would be capable of buying a gold brick at every block on his way down Broadway. Evidently, there is *one* American industry which has not yet suffered injury, and that is the manufacture of tariff planks by tricksters for gulls.

All the tariff and Trust parts of the platform are conceived and expressed in so low and mercenary a spirit, bent on catching votes at any price and wheedling men into campaign contributions, that one asks wonderingly if the intention can possibly be to make the campaign on such issues. Is there nowhere a breath of the old Republican aspirations for liberty and human rights? May not the President and the Republican orators kick all these miserable shuffles about the tariff from under their feet, and make their appeal on a platform of fair play and equal rights before the law for men of every race and color? We should be glad to hope so. We should be glad to believe that the plank about disfranchised negroes and the enforcement of their Constitutional guarantees meant a vigorous and honest campaign on that issue. But, frankly, we see no proof that the party is in earnest about all that. Its chief thoughts are of war, conquest, money, and special privilege; and devotion to oppressed peoples goes ill with such absorptions. What de we find the Convention doing with the prayer of 7,000 college presidents, bishops, philanthropists, and reformers that it speak a word of hope to the Filipinos? Throwing it into the waste-basket. Suppose 7,000 manufacturers had united in asking a tariff favor! The Republican party would have bowed obsequiously to its masters. But the pleaders for liberty knocked at its door in vain.

We can judge Republican professions of solicitude for the negro only by Republican deeds in his behalf. The party has taken no decided step to recognize him as a man, fully entitled to his political rights. It permitted the nomination of a negro collector to go unconfirmed by a Republican Senate, simply because he was a black man. It talks now about "Congressional action," but what has it been doing with its Congresses while the negro has been discriminated against? Absolutely nothing. It has not even, by the Committee on Credentials, looked into the grossly unfair and illegal conditions of the suffrage in the South. Until it gives us something more than vague promises, therefore, we have no reason to suppose that it means to stir in this matter. A catch-all platform simply has a plank to catch the negro vote in the North. That was what Senator Hanna frankly confessed to be the object of the Ohio platform last year, and, till better advised, that is what we must think was the sole design of the Chicago platform.

All told, it is melancholy reading for those who remember how hatred of slavery and oppression everywhere was for years the very breath of life in the Republican party. That spirit is fled. The party falls in the dust before its new idol, and shouts only, "Great is our goddess Protection!" And even in that pitiful enslavement it has neither consistency nor courage.

"THE SOCIETY OF TO-MORROW."

The little band of French economists of which M. de Molinari is perhaps the most prominent, has long occupied a unique position. They are free-traders in a country sodden in protectionism; they uphold the liberties of the individual in a community which seems steadily drifting into socialism. In a sense, these men may be called unpractical theorists; they preach to an evil generation, which cares nothing for their message. One might suppose that they would give up—not their doctrines, for that would be mental suicide, but their attempts to persuade the world of their truth. What is the use, they might well exclaim, of preaching to those who will not listen and who cannot understand?

Very far from this is the attitude of M. de Molinari and his associates. In the *Journal des Économistes* their principles are set forth now as they have been from the beginning, and from time to time are published with fresh applications in books distinguished for clearness of grasp and admirable literary style. Like the old philosophers of whom Plato said that they went on their way without caring very much whether they were understood or not, the French economists have been content to declare the truth and to support it with arguments that are unanswerable, thinking their unpopularity no excuse for abandoning their mission. In a book entitled 'The Society of To-morrow,' just published by Messrs. Putnam, M. de Molinari contends that mankind is on the eve of passing into a greatly improved political state. He brings out with great force the truth, to which we are blinded by the maxims of democracy, that government always and everywhere is in the hands of a ruling caste or class. Governments, he explains, are of the nature of commercial enterprises. They furnish services, the chief of which are internal and external security:

> "The directors of these enterprises—the civil and military chiefs and their staffs—are naturally interested in their aggrandizement on account of the material and moral benefits which such aggrandizement secures to themselves. Their home policy is therefore to augment their own functions within the State by arrogating ground properly belonging to other enterprises; abroad they enlarge their domination by a policy of territorial expansion. It is nothing to them if these undertakings do not prove remunerative, since all costs, whether of their services or of their conquests, are borne by the nations which they direct."

The nation has really no choice but to accept the policy of its Government. When the nobility ruled, it had a certain proprietary interest in the nation. The people were its estate, which it was interested in having flourish. The power exercised by the monarch or the aristocracy was justified by the state of war in which mankind has until recently lived. The necessity of repelling attack gave the sovereign unlimited power over the lives and wealth of his people. When the ownership of the political establishment passed into the hands of the na-

tion, representatives, agents, or delegates undertook to exercise this power. They are nominally chosen by those members of the nation who possess political rights, but they become the nominees of parties. The latter are really armies contending for the advantages which go with the exercise of government. In order to enlist recruits they must promise rewards, which consist in offices of all kinds. The managers of the parties are compelled to make the interest of party supreme, regardless of the interest of the commonwealth. In fact, the nations find themselves to-day overwhelmed with debt, and compelled to apply two-thirds of their enormous taxes to military purposes.

Clearly, M. de Molinari argues, the conditions suitable to the state of war have been perpetuated in an age which already enjoys the state of peace. There is no longer occasion for military expenditure, or for the absolute control exercised by Government over the liberties of its subjects. The limits of nations are now defined; the titles to the several parts of the earth have been quieted. Just as the individual yielded a portion of his liberty to the community in order to obtain protection, so the nations must now relinquish their right of private war. A collective guaranty against aggression must be substituted for the armaments that are now crushing the life of the peoples. The smaller States of Europe are no longer required or allowed to wage war; the concert of the Powers compels them to adjust their quarrels by arbitration.

This association of the great Powers is compelled to justify its interference with the proceedings of States which, though small, are nominally sovereign and independent. They do so by appealing to the rights of humanity and the demands of civilization. Thereby they invoke a higher law than their own sovereign will, a greater power than that of their armies. The ramifications of trade are now so extensive that all nations may be affected by a war between any two Powers, and the interests of neutrals are more and more asserted and recognized. Release from the burdens of this state of war will enable civilization to bound forward. "The economy in blood and treasure will be no more than an incident of the benefits accompanying the advent of a state of peace. A new cycle of progress will be opened, the era of a new and better life for humanity."

It is easy to sneer at Molinari's powerful argument as implying but an iridescent dream. No doubt the ruling classes will struggle hard to maintain and to extend a system of government which furnishes them so many advantages at the expense of the common people. But the stars in their courses fight against them. The Tribunal of The Hague has already done far more than would have been thought possible a few years ago, and it has but begun its work. It remains only for enlightened and benevolent men in all countries to insist that their governments shall enter into a confederation for the orderly adjustment of their differences. If individuals submit to the decision of the court of justice, associations of individuals can do so. It is immaterial that these associations are called nations; or rather it is all the more material that these great communities should take the final step in the advance of civilization which began with the suppression of private war.

THE COLLEGE SMALL BUT FIT.

The accomplished Latinist, Professor Morris of Yale, speaking at the Williams Commencement dinner, shook the idols of that typical small college rather sharply when he reminded it that, Topsy-like, it was growing into a large college. He added that his hearers should welcome the change, as he did, and give over the futile attempt to remain small; trying rather, in full consciousness of inevitable increase of numbers, to maintain their traditional social and academic life. His forecast is fully borne out by the statistics. Thirty years ago the small colleges of the East—Williams, Lafayette, Brown, Bowdoin, Amherst, Dartmouth, Hamilton, Union, Rutgers—averaged somewhere about 200 students each; to-day, with few exceptions, these colleges number about 400, while Dartmouth with over 700, and Brown with over 900, have passed numerically out of the class. In another aspect, the small colleges of to-day have about as large an attendance as the large colleges of a generation ago, and only the multiplication of new institutions—an unlikely event—will save the small colleges from becoming virtually extinct as such.

That, many feel, would be a pity; for there is not merely a relative but an absolute difference between an academic body of 300 and, say, one of 500 students. In one case there is considerable uniformity of experience, in the other extreme diversity. With classes of one hundred and fifty, or so, the divisional system breaks down, and undergraduates, instead of all coming under the instruction of a few professors, are distributed to a multitude of underlings in the academic hierarchy. At this point, too, the homogeneity of classes of about one hundred or less gives way to the more diversified activities of clubs, fraternities, and the like. So that the peculiar social and academic training which constitutes the stamp of the college tends to become blurred, and in the end we might expect to see the Amherst, Williams, or Bowdoin graduate as little redolent of his origins as, say, the bearer of a *Reifezeugniss* of his gymnasium. Or, putting it in other words, the organiaztion of a college of 500 men is necessarily much that of a college of 1,000 or 2,000, and uniformity of organization reacts upon the product—the graduate.

Now, we are not unwilling to admit that a compensating gain of larger numbers and broader activities does make up in some measure for this transformation of a peculiarly American institution, but it would be unfortunate, we are certain, that the only survivors of this historic type should be such colleges as are not small by choice, but by reason of poverty or denominational association. There is, we are convinced, a field for a group of colleges which should be small by preference—aristocratic, if you will, but aristocratic along intellectual lines. Imagine a college which admitted not more than 300 students, and provided the traditional curriculum, in which the classics, mathematics, and philosophy held the chief place. Suppose the course to be purely disciplinary, and arranged absolutely without reference to the future callings of its students. Such a college would seek in its small teaching force—twenty would be a sufficient faculty—primarily character and ability in the classroom. In all matters it would set quality of instruction before quantity of subjects and courses. Science it would teach, but chiefly in its philosophical bearings. All the men would pursue the same courses, but the contact between professor and pupil would be so close that the ambitious undergraduate might be carried in any subject far beyond the minimum requirement, while in the companionship of men of wide culture many subjects—the literatures of England and Europe, a fair acquaintance with history, all the painful small beer of the new-style curriculum—would be acquired almost without effort. For it may be assumed that the man who knew not only Greek paradigms, but the Greek drama, would find his way easily to Shakspere, Molière, or Calderon.

Utopian as this fancy may seem, nothing stands in the way of its realization except expensiveness and the difficulty of getting vitality *ex cathedra*. As for the money, people will pay for what is clearly good value; as for the danger of uniting debilities and calling the conglomerate a facuity, good ability can be had when the cause is worth its while: Kings at Cambridge and Balliol at Oxford find no difficulty in securing dons worthy of their great traditions. Plutocracy—the undoubted bane of our older colleges in the East—would hardly invade a college that admitted only honor men, while by a prudent allotment of free scholarships the tendency to merely social aristocracy would be offset. Indeed, the enthusiasm and personality of its teachers would constitute them admirable mentors for the sons of the wealthy. One can imagine an atmosphere—it exists in some of the

English colleges—in which the vulgar ostentation of wealth would be impossible. On the part of the professors would be required the conviction that simplicity and discipline are the ends of education. With them it would lie to prove that Greek and Latin have never worn out; that only the tradition of teaching them has decayed.

Such a college would, we believe, soon create a place for itself, through the conspicuous efficiency of its graduates in active life. Witness the Japanese students of the Buddhist books who plan brilliant campaigns, or the Oxford honor-men in classics who rule distant provinces of the Empire. To establish a college on this basis should attract a benefactor with an eye to the original. Meanwhile, any of the older colleges which, renouncing the vain competition with the universities, should elect to remain small on this basis, ought to win some better fame than that of an interesting survival.

THE SECRET OF HAWTHORNE.

On October 25, 1835, Nathaniel Hawthorne, then in his thirty-second year, wrote this memorandum:

"A person to be writing a tale, and to find that it shapes itself against his intentions; that the characters act otherwise than he thought; that unforeseen events occur; and a catastrophe occurs which he tries in vain to avert. It might shadow forth his own fate—he having made himself one of the personages."

Could Schopenhauer have read this note he might have taken it as the text of his wonderful essay on Genius:

"Normal intellect," says Schopenhauer, "is the medium of motives; it originally sees no more in things than their relation to the will—the direct, the indirect, the possible." "Where the representing power of the brain has such a surplus that a pure, distinct, objective picture of the outside world is formed *without a purpose*—a picture which is useless for the purposes of the will, and in the higher degrees a hindrance, nay, which can even be an injury to them—there the predisposition at least exists to that abnormity which is denoted by the name of *genius*, indicating that here something foreign to the will—that is, to the real ego—as though it were a genius coming from the outside, seems to become active."

That Hawthorne did not write the particular tale suggested by his note of 1835 would thus be explicable by the fact that most of his great works are more or less of that character. And the explanation would be confirmed by Hawthorne's experiences. The most delicate of moralists as to his life and will, his book 'The Scarlet Letter' was accused of immorality. It wove a halo around an impenitent outcast who says to her reverend lover, "What we did had a consecration of its own." Twelve years before, in 'Endicott and the Red Cross' (1838), the wearer of the letter had no halo: "Sporting with her infamy, the lost and desperate creature had embroidered the fatal token in scarlet cloth, with golden thread and the nicest art of needlework." Hawthorne being one-third Puritan but two-thirds artist, Hester's "nicest art" threaded its way to the artist and carried the Puritan along helplessly. As for the famous portrait of the old inspector of the Custom House, after the artistic two-thirds (the genius) had finished it, the prudent one-third limpingly tried to overtake and arrest it. But advanced sheets had already been sent to the *Literary World*, the veto was too late or disregarded, and Salem Custom House turned into a hornet's nest. A daughter of the deceased inspector talked of "cowhiding" Hawthorne. "He holds a dark steed hard," said Emerson of Hawthorne, but the dark steed had a way of taking the bit in his mouth, and sometimes brought the benevolent man to wonder at what his genius had done. My friend Mr. G. M. Williamson has in his Hawthorne collection a copy of 'The Scarlet Letter' with a marginal note in Hawthorne's handwriting on this sentence relating to the inspector: "I have heard him smack his lips over dinners every guest at which, except himself, had long been food for worms." Hawthorne has written on the margin: "I myself have often been the recipient of his titbits, and my children also. This is my gratitude for it."

Mr. Williamson sends me a letter written to him by a scholar born in Salem (1834) who says:

"I remember very well walking up Essex Street behind Hawthorne, who wore an ample cloak with a high velvet collar, and following him—for we were bound for the same place—into the Salem Athenæum Library, where he would glide into one alcove and I into another, he to read I know not what, and I to devour the works of Fielding and De Foe. There seemed then to be a sort of lonely, mysterious air about him, quite in keeping with the impression made on me shortly afterward by 'The Scarlet Letter.' I can distinctly recall the hubbub created by the preface, and the loudly expressed indignation of the clerks in the Custom House and their families. It was a Mr. Dutch, I think, who revelled in the memory of a goose he had once eaten, and it was a daughter of his who talked of 'cowhiding' Hawthorne. Mr. Dutch clung to his queue and shoebuckles after these fashions had disappeared. 'Joe' Waters was the young man with literary aspirations; it was a brother of his who worked out the history of John Harvard, founder of the University. General 'I'll try' Miller, who lived in a brick house near the Custom House—a house once occupied by Bowditch the mathematician—I can see in my mind's eye at this moment, and Hawthorne's description of him is stereoscopic."

Many examples of the waywardness of Hawthorne's genius might be quoted: he narrowly escaped a lawsuit for the character of Judge Pyncheon ('House of the Seven Gables'); he vexed the "come-outers" flocking to Emerson ('Mosses from an Old Manse'), also many Brook Farm pilgrims ('The Blithedale Romance'), and set England in an uproar by 'Our Old Home.' These echoes surprised and distressed Hawthorne; he had no desire to trouble any mortal. It was also a sorrow to him that the shadows were so thick in his tales. "Ah, if I could only write a sunshiny book!" So he said to Fields; but happily his genius said, No. Sunshine! What, and put out all the mystical constellations and the tender moonlight and sweet dreams! Hawthorne never wrote a popular book. The 'Life of Franklin Pierce' bearing his name* brought sunshine to a political party, and a kind of sunshine to the home his genius had stinted; but those for whom his real works were written love him as Ben Jonson loved Shakspere, "on this side idolatry," because through him spoke the World-soul from its depths. Emerson, prophet of the Over-soul, recognized its counterpart where

> "The patient Dæmon sits
> With roses and a shroud;
> He has his way, and deals his gifts—
> But ours is not allowed."

I long ago remarked that there was a Hawthorne cult, and that its devotees were nearly all people publicly advocating causes and reforms with which Hawthorne had no sympathy. Hawthorne's 'Life of Franklin Pierce' probably made Pierce President, but while other men of ability on the pro-slavery side—Webster, Choate, Everett, etc.—had been steadily impaled by anti-slavery orators, I remember no denunciation of Hawthorne. John Lothrop Motley was his most intimate friend in Europe, and had him as his guest for a time in London. I asked Lady Vernon Harcourt, Motley's daughter, how she and her father, with their strong anti-slavery principles, managed to get on with the biographer and consul of Pierce. "Ah, well," she said, "he came from Fairyland." W. W. Story and his wife in Rome, who described to me the jubilant days when Hawthorne and Motley were both there, and how the three men rambled together like boys in holiday, felt, like Hiram Powers and Sumner, inclined to whitewash Pierce because he had lifted the Hawthornes out of poverty.

When 'Our Old Home' appeared, the English reviews were so wrathful that Fields told me Hawthorne begged him to send no more of them. But when, soon after I was in England, meeting the author's friends and readers, I found no resentment among them at all. Browning, Lord Houghton, Francis Bennoch, Lord Dufferin, Tom Hughes, Henry Bright, Charles Bray—all active sympathizers with our anti-slavery cause, all patriots—ignored the limitations of the individual Hawthorne, and saw only the illimitable genius and the wonderful personality in which it had enshrined itself. "At my table," said Lord Dufferin to me, "he did not talk much, but showed his interest in those present and in everything said. And we felt at every moment that we were in the presence of those wonderful eyes." Mrs. Charles Bray, wife of the author of a work on 'The Philosophy of Necessity' which attracted Emerson (herself a literary lady and the particular friend of George Eliot), at Coventry, wrote me (1893) of Hawthorne:

"He took me in to dinner, and I think talked exclusively about Miss Evans, asking questions of all kinds about her, which I was glad to answer to one so appreciative and so interesting as himself. He was one of the few men of genius whose personality corresponded with the ideal we had formed of him, and to this day I can recall vividly his modest, almost shy, manner, and his very expressive and strongly intellectual face."

When I first saw Hawthorne, fifty-one years ago, there arose in my mind the line of Spenser, "Soul is form and doth the body make." I have read everything he ever wrote, have written his life, and followed his tracks through Europe and America, and at every step have had the grand figure and face of the man rise before me in a quasi-symbolical way, as if his marvellous creations were all summed up in him. Although we must, I suppose, continue to

*"I did not send you the 'Life of Pierce,' not considering it fairly one of my literary productions."—*Letter to Horatio Bridge*, October 18, 1852.

speak of "personality," I sometimes feel that there ought to be another word descriptive of the rare genius which cannot be confused with individuality, but represents universal ideas in a unique way, and this by necessity. Coleridge hesitated to apply the word "personality" to deity, and spoke of "the personeity of God." It is a far cry from the translunary deity of Coleridge to the World-soul that inspired Hawthorne, but where the actualities of human nature and life take such complete possession of an intellect that it is detached from egoism and self-interest, some profounder word than "personality" is needed to define it. And some such word would long ago have been in use were it not that this kind of genius is too rare to need a name; and indeed it at times possesses uncultured and inartistic minds that cannot give its practical uselessness the attraction of beauty, and so obtains the name of eccentricity, or perhaps insanity.

The combination of qualities in Hawthorne was rare; he was a scholar, a gentleman, a lover, an artist; that he should also have a genius supernatural enough to impress all these qualities to the work of imaging the spirits of nature, made him the magician imagined by Shakspere in *Prospero*. There have been great men who may conceivably return; but there can never be another Hawthorne. The one given us was nearly starved, and not even the still, small voice that summoned Hawthorne from Salem Custom House is now calling for the genius whose products are uncultivable and unmarketable.

MONCURE D. CONWAY.

THE LOUISIANA PURCHASE EXPOSITION.

ST. LOUIS, June, 1904.

So little in the way of mere description of the Louisiana Purchase Exposition has appeared in Eastern papers, that a feeling of amazement can hardly fail to strike the arriving visitor as he enters the grounds, first views the beautiful effect, and begins to apprehend the immensity of plan. The countries of the world and their products would seem to have vied with architects, sculptors, and landscape artists to produce a whole of surpassing splendor, which not to see means distinct loss.

The centre, the point of departure, as it were, for a sort of radial system, is, of course, the great Festival Hall, crowning a fine natural hill. Upon its enormous organ constant recitals will be given by famous organists of many nations. From either side of this dominating structure the imposing "Terrace of States" curves outward, a chain of colonnades flanked by sculptured groups and by flower beds in fullest bloom, and ending in a noble pavilion at either end. Immediately in front of the Festival Hall a series of mighty cascades tumbles downward into the quiet central lagoon; from the pavilions branch two lesser lagoons, which, with various intersecting canals, flowing under low, arched bridges, make a charming system of waterways.

As one emerges upon the high terrace before Festival Hall—perhaps the finest vantage-point for a first general view of the heart of the Exposition—the effect is well-nigh dazzling as the glance wanders across the foam of descending cascades to a veritable fairyland of beauty, a white city of radiant architecture and adornment, fountains near at hand springing up to catch the sun in a myriad rainbows, flowers of a thousand tints brightening lawns, banks, and sunken gardens, fine statuary on every hand, and all in wonderful harmony with a dignified and impressive plan. Comparison with the Court of Honor at Chicago at once suggests itself, but without serious detriment to either. Each is perfect, a gem, in its own way. At Paris in 1900 there was no central expanse comparable to either of these, with the possible exception of the vista from the Trocadéro down to the Eiffel Tower. In magnitude, actual and spiritual, Saint Louis stands unrivalled.

Another method of attempting to apprehend superficially the immensity of the entire scheme is to take a car of the intramural railway, at its first station near the building devoted to Varied Industries, and circumnavigate the grounds. With their twelve hundred and forty acres, this is not a trip of a moment. We first pass the Transportation Building, which, by the way, contains far more of interest than corresponding exhibits in any previous exposition, showing everything on its subject from Indian runners, pony express, and the white-topped "prairie schooner" of the early settler, and a dozen or more old locomotives in progressive order, to the most perfectly equipped modern train, in which private and parlor cars vie with one another in black oak, Tiffany lamps, and other truly artistic furnishings. Nor are the examples of the subject confined to this country, for sedan chairs, palanquins of various sorts, and the picturesque methods of travel prevalent in many portions of the globe, primitive and civilized, ancient and modern, offer hours of object-lessons to the non-travelled visitor.

Great Britain's pretty brick country-house, with its formal gardens, huge English policemen, and historic furnishings, comes next, and just beyond rises the lovely curved roof and brilliant coloring of China's Oriental domain. Inside are many rare and beautiful objects in old carved furniture inlaid with ivory and pearl, ancient embroideries, scroll pictures, and more than the usual native wealth of adornment. After this the car strikes the outskirts, and, under the shade of many old trees originally in the Forest Park appropriated to the Exposition, reaches a station near the permanent stone buildings to be occupied a year or more hence by Washington University. At present the Board of Lady Managers has here its pleasant headquarters, while another wing contains anthropological exhibits and the Jubilee presents of Queen Victoria. Sometime the inner quadrangle will be an academic retreat, but for this year its inauguration is confided to the Exposition visitor.

Still onward, the car will carry one past the Physical Culture Building, the big athletic field, and stadium, capable of seating nearly 30,000 persons, to the American Indian industrial exhibit. But of greater interest to the casual visitor are the native Indian villages just beyond, in whose picturesque tepees organized industries never had a place, whose architecture is wholly aboriginal, and where the simple life of squaw and pappoose and unemployed brave goes on in full view of the passing throng. Other native villages also cluster in this portion of the grounds, most conspicuous those of Filipinos and Moros, many shacks overhanging the waters of a small pond, quite after their home habit. A good imitation of the walls of Manila and one of its gateways has been erected here, the whole approached by a bridge, which might span the actual moat surrounding the walled city itself.

Fortunately, the intramural cars run slowly, and one has ample opportunity to watch the approach to the Forestry and Fisheries Building, which contains an immense amount of interesting and valuable material, New Zealand and Japan especially making a fine showing. The Government pictures of good and bad tree-cutting, the forceful illustrations of the really brutal method generally employed in this country of despoiling forests without a thought of their absolute extermination, and, on the other hand, the proper way of cutting conservatively, with an eye to future years, cannot fail, it would seem, to impress even the most thoughtless. The pretty little Ceylon edifice and its opposite neighbor representing India appear just here, and the United States life-saving station, where at intervals during the day may be watched the entire process of rescuing survivors from wrecks. In full view, too, is the huge floral clock adorning the lawn at one entrance of the enormous building devoted to Agriculture, which is said to contain over four miles of aisles. One can well believe it when an entire day may be most entertainingly spent in going once around the outer aisles with only casual inspection of their riches, and then realizing that the whole interior has practically not been touched. The famous floral clock will become constantly more beautiful as the season advances and the dial-figures of blossoming plants grow larger and more brilliant. The minute-hand of this original time-piece is reported to weigh twenty-five hundred pounds.

Throughout this portion of the grounds, and increasingly as the Horticultural Building is approached, is a fine display of gardens, lawns, nurseries, and shrubs, themselves an effective illustration of methods. For ten minutes or more after leaving this building the car passes delightfully through the original park forest, a gently rolling country, richly wooded with oaks, chestnuts, black walnuts, and other trees indigenous to the region, finally emerging at the Inside Inn, said to be capable of accommodating 4,000 or 5,000 guests. While of light and temporary construction, exits are so numerous and the walls so low that it would seem impossible for a fire to result in loss of life. Many of the great conventions have here their headquarters from time to time very conveniently, thus eliminating the nightly crush in trolley cars and suburban trains.

Grouped picturesquely in this hilly quarter of the grounds among the fine old trees are homes of the various States—Missouri's large and airy; that of Massachusetts simple and colonial, with a good but small collection of historical relics. Iowa and Kansas show statues and portraits of their famous men, while Mississippi brings an interesting replica of "Beauvoir," the home

of Jefferson Davis, filled with old mahogany, china, and portraits, many of them genuine relics from the original mansion. New Jersey and Connecticut are very perfectly colonial, the latter showing, perhaps, the most delightful interior anywhere in the grounds. New York and Pennsylvania are imposing and stately, and the others more or less characteristic, as the minds of a State's representatives turned to present effect or historic suggestion. Along shady ways one may reach the big Government Building below, where, from the wide flights of low steps, another fine vista opens over a pretty sunken garden, aflame with flowers, to the central lagoon and plaza. This building is always thronged, its exhibits unfailingly interesting and educative, from representations of the Yosemite and Yellowstone to the famous Signet meteorite, and cases of relics rescued from the Dead-Letter Office. After the "Missouri" station of the intramural railway, but a single one remains before its ending, just after passing the "model city," with town hall, churches, hospitals—a municipal object-lesson well worth study.

Having viewed the beautiful effect from the lofty height of Festival Hall, it is well, after emerging from the car at this final station, to walk a few steps onward in the same direction, until the same vista can be seen from the opposite and lower end. At this point one looks first over the wide Plaza Saint Louis, with its statues and the Louisiana monument, to the central lagoon and cascades, fountains, and Festival Hall. Here surges back and forth under the trees a never-ending, but never closely packed crowd, listening to band concerts frequently in progress from an open pavilion near the centre, or passing in and out of the four great buildings on either hand, devoted to manufactures, varied industries, electricity, and education. The Lindell Boulevard entrance "gives" upon the plaza just here, and affords an effective first view.

There is not space even to touch upon individual exhibits in all these huge buildings, almost bewilderingly diverse and interesting as they are. From French costumes and Redfern gowns, German vases, cut-glass and art silver, to Italian statuary, Dutch tiles, and Tiffany lamps, Arizona turquoise and Austrian chrysoprase, the procession of beauty and achievements grows, and it becomes well-nigh hopeless to absorb even a superficial impression, in a mere week or two, of this conjunction of world industries. Japan is particularly well represented. Besides its own charming houses and gardens in the neighborhood of "Jerusalem" and "Morocco," and its "Pike" temple and teahouse and attendant jinrikishas, nearly every building shows extensive and complete exhibits from this most versatile of nations. And they were installed practically on time.

Much has been written of the unfinished condition of grounds and exhibits, but it almost seems that undue prominence has been given this aspect of the Fair. In May and early June, to be sure, freight cars did come in with belated trophies, many thoroughfares were not paved, and an army of gardeners was still engaged in sodding, planting, and making waste places beautiful. But buildings and general effects were there, and exhibits enough for months of study. And in the last weeks of May every individual laborer's work seemed to tell. By the middle of June unfinished bits were in a rapidly vanishing minority. Of course one cannot understand why every great exposition should apparently of necessity be behindhand by a year or two, and then fail to meet the opening day in completeness as well; and perhaps that will be the point of coming advance in such affairs of the future. But even in May there was much to dwell upon quite as obvious as unpreparedness, and far more interesting. While this point of criticism is at hand, however, we may also mention that the management fails in being considerably less strict than that of Chicago in 1893 as to the throwing about of refuse by visitors; and many fine lawns in the neighborhood of the numerous chairs and benches thoughtfully provided for public comfort are made hideous by orange and banana skins, discarded boxes, and papers. There are receptacles for such things, and printed requests to use them, but these are not steadily enforced, as at Chicago. The Jefferson Guards are helpful and amiable, but not so generally intelligent, as to finding special exhibits or persons, as the corps of young men, many of them students in Western colleges, who push about the countless wheel chairs. Though not as easily propelled or comfortable as Japanese jinrikishas, which would indeed have been a boon in this enormous pleasure ground, the chairs form a welcome relief to most persons from the weariness of continual walking, and there are comparatively few vacant ones. Industrious and conscientious sight-seers, stout women, elderly men, are met at every hand rolling about grounds and buildings with satisfaction and relief depicted upon their wearied countenances.

Two subjects remain, without some mention of which no article, however general, would be even superficially complete—and they are at the antipodes from one another—the Pike and the Art Palace. Prof. Halsey C. Ives, chief of the fine-arts department, says the loan exhibition will be the finest ever shown; and although this central portion of the big building was not thrown open to the public for many weeks, I have had the pleasure of seeing some fine things in process of placing, many splendid sculptures, and premonitions of what is to come. Both wings were early finished, and one may study room after room of German art, beautiful and characteristic specimens of Dutch painting, while Italy, France, and Sweden have contributed generously to the very remarkable whole. In the latter department the portraits by Zorn are especially strong, and are constantly surrounded. In the sections devoted to Japan are some typical snowstorms, early morning mists, and other effects full of the dreamy suggestiveness of the native art, which make these rooms a delight. Just beyond are bronzes, ivory carvings, and wonderful cut velvets, while, penetrating still farther, a room is reached wherein Japanese artists have depicted Japanese scenes, to be sure, but through the medium of foreign training. In some way all the elusive charm, the subtle aroma of the purely native art, has vanished. It is good painting, the technique cannot be criticised, the scenes depicted recall vividly the flowery country; yet it is wholly unsatisfying. Even the faint odor of Japan which always hovers about any considerable collection from its shores, and which touches all these rooms with a reminiscent charm, fails to idealize these good Japanese paintings by Japanese artists done in "foreign" style. The educative value of the Fine Arts Building, taken as a whole, can hardly be overestimated. Indeed, the entire Exposition may be said to give, in the language of a recent visitor, "the maximum of cosmopolitan knowledge with a minimum of mileage."

The Pike is an expurgated Midway, but brilliant enough it is, especially in the evenings, when it is thronged with visitors, many of whom have just come from dining at the "Tyrolean Alps," where most delicious dinners are served to the music of a large orchestra discoursing Wagner and Beethoven as the courses progress. China and Japan, Cairo and "mysterious Asia" add their quota of picturesque passers to the daily evening throng, and it is a spectacle which must not be missed. But far from the Pike, near the central lagoon at night, is where the beauty of the plan comes to fullest flower. Every architectural accent, every dome and pillar, column and tower, and gable—in fact, every line of all the buildings—is outlined in light which sheds a soft radiance into every corner. Fountains and cascades come forth in pale emerald green, gondolas ply softly back and forth along enchanted waterways, and the fairy city of some master mind seems to have come to actual life before us.

We may quote from Mr. Gilder's sonnets of the "vanishing city" of 1893 words equally applicable here. Perhaps this latest embodied dream may yet find its own poet:

"Never before—
Save where the soul beats unembodied wings
'Gainst viewless skies—was such enchanted shore
Jewelled with ivory palaces like these:
By day a miracle, a dream by night;
Yet real as beauty is, and as the seas
Whose waves glance back keen lines of glittering light,
When million lamps and coronets of fire
And fountains as of flame to the bright stars aspire."

MABEL LOOMIS TODD.

THE LAST YEARS OF MME. DE MAINTENON.

PARIS, June 17, 1904.

The last years of Madame de Maintenon were spent in complete retreat, and historians have had nothing to say about it. Whatever may have been the faults of her youth and of her life, she showed, after the death of Louis XIV., whom she survived by four years, that she had a sense of dignity which has generally been wanting in the favorites of kings. She had succeeded in bringing Louis XIV. to the foot of the altar; Scarron's widow had become the wife of the great king, of whom she said, during the years of his courtship, "Je le renvoie toujours découragé, jamais désespéré." A French writer, very severe on Madame de Maintenon, said of her once: "After all, she had one great merit—she kept Louis XIV. from becoming Louis XV." Saint-Simon, who felt a bitter hatred for her, writes in his Memoirs:

"Saturday evening, April 15, the celebrated and fatal Madame de Maintenon died at Saint-Cyr. What a noise this event would have made in Europe if it had happened some years ago! It was, perhaps, hardly known in Versailles, which is so near Saint-Cyr; in Paris, people scarcely speak of it. . . . She retired to Saint-Cyr at the moment of the king's death, and had the good sense to report herself dead to the world and never to set foot out of the

limits of this house. She would see nobody coming from the outside, with the exception of a very small number of people of whom I am going to speak, without asking anything, recommending anybody, or mixing herself with anything that might involve the pronouncing of her name."

Among the few people alluded to by Saint-Simon was her niece, the Countess de Caylus, with whom she corresponded regularly. This correspondence, which has almost the proportions of a diary, was partly and sometimes inexactly published by La Beaumelle. Madame de Maintenon's letters were lately in the hands of Count d'Haussonville; those of Madame de Caylus are in the archives of Mouchy, and their owner, the Duke de Mouchy, has allowed M. d'Haussonville to use them for a study of the last years of Madame de Maintenon.

Marthe-Marguerite le Valois de Villette de Mursay was born on the 17th of April, 1671, in the château of Mursay, which had belonged to Agrippa d'Aubigné. Her father, the Marquis de Villette, was the grandson of Agrippa d'Aubigné. He was a *chef d'escadre* in the French navy. "A Huguenot, like his grandfather, he was hard to convert at a time when all the Protestant nobility were eager to abandon the Reformation; and when he resolved to embrace the Catholic religion, it seems to have been with entire sincerity and without any ulterior motive, for he drily told the King, who complimented him, that it was the only occasion in his life when he had not had for his object to please his majesty." During an absence at sea of M. de Villette, the young Marthe-Marguerite was taken to Germain, with two cousins, who were Huguenots, as she herself was at the time. In her 'Souvenirs' Madame de Caylus says that they all three offered to the persons who wished to convert them a resistance "infinitely glorious to Calvinism." She adds, however: "I wept much at first, but the next day I found the King's mass so beautiful that I consented to become a Catholic on condition that I should hear it every day, and that I should be guaranteed against whipping. This was the only controversy employed and the only abjuration which I made."

Madame de Maintenon has been very justly blamed with this kidnapping of a child nine years old, and this conversion made without the consent of the child's parents. The child was educated from this time under the eyes of Madame de Maintenon, who chose a husband for her as soon as she came of age. The choice was not very happy. Madame de Caylus says nothing herself of her husband, the Count de Caylus, who belonged to the family of the Caylus who was a playfellow of Henri III. and was killed in a duel. Saint-Simon simply says that he was "blasé, and stupefied with wine and brandy." He was always in debt, and after a time Madame de Maintenon had him sent to his regiment. Madame de Caylus lived at court, under the guardianship of Madame de Montchevreuil, of whom Madame de Caylus says in her 'Souvenirs': "She was a person of merit if merit consists in having no *galanteries;* cold and dry, of a sad physiognomy, a mind less than mediocre, and a zeal capable of disgusting the most pious with piety."

Saint-Simon spoke in these terms of Madame de Caylus: "There never was a more intelligent, touching, speaking face, such freshness, so much grace and wit and gaiety, such a seductive creature. She had much success at court, and had the imprudence to become too intimate with the Duchess de Bourbon, a daughter of Madame de Montespan." Madame de Maintenon did not approve of this intimacy, and Madame de Caylus had to leave the court for a little while. M. d'Haussonville will have it that there was another and a more serious cause, which is not alluded to in the 'Souvenirs.' Madame de Caylus had a liaison with M. de Villeroy.

"History," he says, "has been hard upon Villeroy, seeing in him the type of the courtier who uses his favor to climb to the highest offices, and who shows himself incapable of fulfilling them. . . . But when we look a little nearer we can understand how he could have filled so long such a place in the life of a woman like Madame de Caylus, though he was twenty-seven years her senior. In his youth he was called 'le Charmant,' and some women, even if they are of a very noble nature and very distinguished mind, are not insensible to this kind of seduction. Madame de Lafayette, who knew well her own sex, in order to explain the sentiment which draws the Princess of Clèves towards the Duke of Nemours, repeats several times that this Prince was 'admirably well built'; and Madame de Sévigné, always ironical, laughs several times at the impression which the fine legs of the hero produce on the chaste heroine."

Villeroy was not only handsome: he was personally very brave; and Saint-Simon says of him that he was "just the man to preside at a ball, to be the judge at a tournament, and, if he had had a good voice, to sing at the opera the parts of kings and heroes; very well fitted to set the fashion, and nothing more." Madame de Caylus fell under the charm. After she left the court she lived in Paris, in a hôtel in the Rue de Vaugirard, where she led an elegant and free life, gave suppers, and had a salon. Racine was sometimes among her guests; he had not forgotten that when she was at Saint-Cyr she played a part in "Esther." La Fare, the poet, was one of her intimate circle, and wrote verses for her, a few of which are still remembered:

"M'abandonnant à la tristesse,
Sans espérance, sans désirs,
Je regrettais les sensibles plaisirs
Dont la douceur enchanta ma jeunesse.

. . . . . .

Alors j'aperçus dans les airs
L'enfant maître de l'univers,
Qui, plein d'une joie inhumaine,
Me dit en souriant: Tircis, ne te plains plus.
Je vais mettre fin à ta peine:
Je te promets un regard de Caylus."

The great ladies of the time always chose a spiritual director, one of those priests who were the confidants, not only of their faults, but of their troubles of mind, of their doubts, if they had any. Such was their influence that the grave and austere Nicole said: "There is a spiritual as well as a sensual *galanterie.*" The spiritual friend and director of Madame de Caylus was Father de la Tour. He was of a good family, and spent his youth at the court of the Grande Mademoiselle, at Eu or at the Luxembourg. He became an Oratorian. He acquired a great influence over Madame de Caylus, who by degrees changed her life, renounced the society of Villeroy, of La Fare, and of her gay friends.

Her conversion did not quite reconcile her to her aunt. Madame de Maintenon wrote to the Cardinal de Noailles: "I should have been pleased if I had seen her simple, valuing piety everywhere, reading all that is good, without pretension, and seeking the greatest simplicity as befits our sex; but there is no more simplicity amid all our novelties. Women trail pride with them; they want books made for them, fine translations. I don't know why the spiritual directors of these women do not keep them more humble." This last was in allusion to the Jansenists, for Father La Tour, though he was a superior of the Oratorians, was suspected of Jansenism. Dangeau writes in his Journal of January 7, 1705: "The King has given a pension of four thousand francs to Madame de Caylus. She already had a pension of six thousand. It has been desired that she should cease to be under the direction of Father de la Tour, and she has taken a director who does not belong to the Oratory."

The letters of Madame de Maintenon to her niece are well worth reading. She suspected the latter of not being seriously changed:

"You have never been devout but for politic reasons; you think only of marrying again [M. de Caylus died at Brussels in 1704]. . . . Live in peace, my dear niece; don't become worldly again. Choose a certain number of friends to make your particular society. See few men and only honest men. Live in the old fashion. Have always a woman working in your room when you are with a man. Mistrust the most virtuous of them; mistrust yourself. Believe one who has had experience and who loves you. You are still young and handsome. In God's name, don't commit yourself, and don't commit others. Don't be obstinate in anything. Follow the common rule. Be simple, and forgive my affection this little instruction."

Think of this "instruction" coming from a person who was almost the Queen of France, who had the court of Versailles under her sway, Louis XIV., the princes and princesses of the blood at her feet! It is clear that, with these sentiments, Madame de Maintenon did not find it difficult to change her life after the death of Louis XIV., and to retire to Saint-Cyr, From her retreat she continued to write constantly to her niece. Madame de Caylus survived her aunt by ten years; she died a few months after Villeroy, on April 15, 1729. The *Mercure* mentions her death in two lines: "In this month died the Countess of Caylus, an infinitely distinguished person. Her death occasions regrets." And this is all. But, in truth, Madame de Caylus would not have been remembered if she had not been the niece of Madame de Maintenon.

Correspondence.

THE ECCENTRIC CAPTAIN M'NIELL.

TO THE EDITOR OF THE NATION:

SIR: In a review of the life of the famous Sir John Colborne, Field-Marshal Lord Seaton, in the *Nation* of May 19, 1904, your reviewer recites that, while in Italy, Colborne met an American sea captain—name not given, but described as the ugliest man he ever saw—who gave a ball at Naples and borrowed a beautiful band, and, after the ball was over, sailed away, and took the band off to America as a present to the President, for which he was dismissed the service; adding, "But what, we wonder, became of the band?"

By referring to Cooper's 'History of the Navy of the United States' (vol. i., p. 355, 1st ed., p. 324, 2d ed.) it appears that this

officer was Capt. Daniel McNiell of the frigate *Boston* 28. When, in 1801, President Jefferson appointed Robert R. Livingston minister to France, Capt. McNiell was ordered to carry the new envoy to a French port. After encountering a heavy gale in the Bay of Biscay, in which he discovered perfect seamanship and the utmost coolness under circumstances particularly trying, Capt. McNiell landed his passengers and proceeded to the Mediterranean. In a note Cooper adds:

"The eccentricities of Capt. McNiell have become traditional in the service. While at Sicily during this cruise a band belonging to one of the regiments quartered at Messina was sent on board the ship, and he brought the musicians to America, it is said, without their consent. A portion of these men were on their way back in the *Chesapeake* in 1807, when that ship was attacked by the *Leopard*. On another occasion, he is said to have sailed from Toulon, leaving three of his own officers on shore and carrying off three French officers, who had been dining on board, with a view to keep up his complement! The latter were carried across to the African coast and put in a fishing vessel, but many months elapsed before all his own officers could rejoin their ship. Capt. McNiell subsequently commanded a revenue cutter, and performed a gallant thing in the war of 1812. He is said to have been the son of the Capt. McNiell who commanded the *Boston* 24 in the war of the Revolution, though we possess no other evidence of this fact than common report. Neither his seamanship nor his gallantry was ever questioned."

Capt. McNiell was not dismissed the service. When the *Boston* returned home after this cruise, he quitted the service under the Reduction law of 1801, which required the sale of all ships of the navy except thirteen frigates, and dropped all the captains but nine. Among other captains who left the service under this reduction were the elder Decatur, father of Commodore Stephen Decatur, and Christopher R. Perry, father of Commodore O. H. Perry. The first lieutenant of the *Boston* on this last cruise of Capt. McNiell was the lamented Richard Somers, who perished in the explosion of the *Intrepid*, the "Infernal," or floating mine, which Commodore Preble sent into the harbor of Tripoli on the night of September 4, 1804.

FRANKLIN L. CHASE.

CHICAGO, June 23, 1904.

TELLING THE TIME IN ITALY.

TO THE EDITOR OF THE NATION:

SIR: There are some who oppose all reforms in our ways of doing things on account of the trouble involved in making the change. They are unwilling to make any present sacrifice for a future good. For this reason many improvements in our methods of measuring and recording time have been delayed or defeated. Consider the system known as standard time, according to which places take their time from that of the nearest of certain meridians, namely, that of Greenwich, and those of 15°, 30°, 45°, and so forth, of east and west longitude. The result is that all times differ by whole hours. The advantages are untold, as all know who travel. Yet France still clings to Paris time, and a temporary inconvenience stands (with "patriotic" considerations) in the way of a lasting benefit. Again, the Julian calendar still survives in the countries where the Greek Church is dominant. Though the confusion attending the change to the Gregorian calendar would undoubtedly be great, the gain in having one calendar for all Christian nations would be incalculable. Yet the reform has been delayed for centuries.

Here in Italy there is in use a reformed manner of telling the hours of the day, which must be destined in time to prevail everywhere over the traditional manner. The hours are reckoned consecutively throughout the civil day, beginning with midnight. Noon is twelve o'clock; then follow thirteen o'clock, fourteen o'clock, and so on, up to twenty-four o'clock, or midnight. Each day has its own system of hours, and this is carried to the logical conclusion that after midnight the times are reckoned, not as 24.01, etc., but as 0.01, 0.02, . . . 0.59, because these belong to the new day, not to the old. Thus, all the difficulties of A. M. and P. M. time vanish. The Italian railway time-tables are absolutely unambiguous; no typographical device, such as the use of black-faced type, is necessary to reinforce the letters A. M. and P. M. Yet, I suppose, in spite of the care taken to distinguish morning and afternoon hours in our time-tables, we have all at some time or other made this blunder of confusing them. In Italian time-tables black-faced figures are used for the important fast trains.

As regards the serviceability of this system, I can testify that it took very little time to become used to it, even without the help of the Italian clock-face. This has Arabic figures for the hours after twelve o'clock inserted within the circle of Roman numerals to which we are accustomed. That is to say, under I you have 13; under II, 14; and so on, with 24 under XII. For the first twelve hours you use one set of figures; for the second, the other. But it is also easy to begin by associating 15, 18, 21, with 3, 6, 9 P. M. At first there was a tendency to think of 17 o'clock, for instance, as equivalent to 7 instead of 5 P. M., as if the decimal system had been introduced into our reckoning of hours. But this soon disappeared.

It is now a number of months that I have travelled by the Italian time-tables, and there is no doubt in my mind that the system is both far superior to the usual one, and by no means hard to become used to. It must be confessed that clocks apparently still strike the old hours between noon and midnight, and this is natural: twelve strokes are quite enough to count conveniently. But if some system of grouping the strokes could be introduced, it is conceivable that even 24 o'clock might be struck with clearness. On shipboard use is made of this principle of grouping for striking "bells." I am informed that the new system has been in use not more than four or five years, and very naturally both systems are in concurrent use in ordinary affairs. Why cannot the railroads of the United States inaugurate this logical and convenient manner of time-keeping in America, where we pride ourselves on adopting good things as we see them?

C. W. L. J.

SALSOMAGGIORE, June 7, 1904.

Notes.

The probable title of Prof. Willard Fiske's new work, for which the index to volume one is being prepared, will be 'Chess in Iceland and in Icelandic Literature, with Historical Notes on Other Table-Games.' The second volume will consist two-thirds of appendices, with a few notes, and will close with a bibliography.

Through L. C. Page & Co., Boston, Francis Miltoun will add to his 'Cathedrals of Northern France' a companion volume on the 'Cathedrals of Southern France,' with copious illustrations by Miss McManus.

The Oxford University Press will republish Tocqueville's 'L'Ancien Régime,' edited by G. W. Headlam, and with a text freed from the misprints common in the French editions. Mr. Frowde is about to bring out a catalogue of the loan collection of English historical personages who died prior to 1625, exhibited in the Examination Schools at Oxford under the auspices of a committee of the Oxford Historical Society. It will contain photogravure reproductions of the more striking portraits; and as "other exhibitions on the same lines are to be held later, at which more modern pictures will be on view," the new catalogue is likely to be first of a highly valuable series.

A decade has elapsed since the first publication of Havelock Ellis's 'Man and Woman,' a comparative study of sexual differences, which, though calculated for the general reader, had a strictly scientific basis, and has prompted further experiments and observations, creating the meat it fed on. So great, indeed, has been the accumulation of material that a fourth edition is now issued (Scribners), larger by fifty pages, besides a close-packed appendix of twenty more, effectively and temperately meeting Prof. Karl Pearson's criticism of Mr. Ellis's conclusions as to variability in man and woman respectively. In the retouching of his work, Mr. Ellis has had most to change in the chapter on the senses, where his original conclusions seemed sometimes paradoxical and have not always been sustained; but even here the much wider research needful to arrive at absolute certainty may swing the pendulum back again. His final summing-up is substantially undisturbed. We are glad to notice mention of many translations into foreign languages. This stimulating, informing, and liberalizing work deserves to be read by every thinking person.

There is something admirable in the steady output of the great Western serial enterprises like the 'Jesuit Relations,' the 'Philippine Islands,' etc. Already we have volumes two and three of Mr. Reuben G. Thwaites's reprints, "Early Western Travels (1748-1846)" (Cleveland: The Arthur H. Clark Co.). The first of these is wholly filled by John Long's 'Voyages and Travels,' 1768-1782, published in London in 1791, a work popular in its time, and translated into Continental languages, though he was but a poor geographer. Of greatest value may be thought his Indian vocabularies, the Chippewa in the lead, partly derived from Jonathan Edwards, and partly in turn used by John Pickering in reprinting Edwards. Long's record of customs, especially among the savages with whom he hunted for furs and traded, possesses genuine worth. Volume three is composite, beginning with a special and the first English version of André Michaux's Journals, or so much of them as fall within the scope of Mr. Thwaites's series. They bear date of 1793-

1796, and are less readable than important. His son François's 'Travels' west of the Alleghanies is copied from an English translation a hundred years old, his date being 1802. Finally, a classmate of John Quincy Adams, the Rev. Thaddeus Mason Harris, is drawn upon for his journey northwest of the same range in 1803. At Pittsburgh he came upon the flow of Seneca Indian oil, which he recognized as petroleum, and whose only use then was medicinal. A portrait of the younger Michaux serves as frontispiece, and facsimiles and maps adorn both these handsomely printed volumes. Mr. Thwaites's introductions and notes are respectively of great utility to the reader.

The "Narratives of Captivities" in progress with Burrows Bros. Co., Cleveland, is continued with 'The Dangers and Sufferings of Robert Eastburn,' reprinted from the edition of 1758, with introduction and notes by John R. Spears. Eastburn was "captivated" near Rome, N. Y., taken to Canada, and adopted by the Indians. He was of English birth and Quaker descent, but Whitefield captivated him for the Presbyterian faith. He was made prisoner at forty-six, and gun in hand, deacon though he was. He praises his French captors for acknowledging their victories with thanks to God on their knees, an example "worthy of imitation" and "which may make prophane pretended Protestants blush." These never acknowledge a God or a Providence in their military undertakings; "is it any Wonder that the Attempts of such are blasted with Disappointment and Disgrace!" So we remember to have heard a colored preacher enforce the power of prayer (to a colored regiment) by citing the successes of Stonewall Jackson. Eastburn's hardships were severe, but his constitution was equal to them.

'Under Croagh Patrick' (London: John Long) is a series of charming sketches of life in the west of Ireland by Mrs. William O'Brien. She has published the same in French under the title of 'Silhouettes Irlandaises' (Paris: Guillaume & Cie). There is little indeed in the first named to lead us to suppose English is not the author's native tongue. The manner of life of herself and husband on Clew Bay is simply told— their farming and gardening, all about their neighbors and their pets. The poor people around them are regarded with kindly eyes, their faults extenuated, and their virtues made the most of. Sketches of character and homely anecdotes abound. It is some time since we have met with a book relating to Ireland written in such an altogether cheerful and hopeful spirit; and surely no change can be greater than that from the storm and stress which for twenty years kept Mr. O'Brien so prominently before the world to the idyllic life here described as now led on the wild coast of the Atlantic. Have the quieting influences of this life and these surroundings had anything to do with leading Mr. O'Brien, apart from most of his old associates of the Land War, to take such a roseate view of the act of last year as a satisfactory settlement of the Irish land question?

If the term "fascinating" can be applied to any British "Blue Book," it may so be to a foolscap folio volume of 582 pages lately published—General Report of the Census of India, 1901. (The census proper appears to run to over fifty volumes.) One need go no farther for arithmetical information as to that vast dependency of the British crown. The essays (volumes, if published separately) upon education, occupation, language, religion, marriage, and caste, are especially valuable. The book is one that should be in the possession of every person specially interested in the East. During the decade 1891-1901 the population increased from 287 to 294 millions—a ratio of but 1.5 per cent., as compared to the increase, 10.9 per cent., from 1881 to 1891. This difference, some 25 millions, is to be accounted for only by the famines and pestilences that have lately supervened. No wonder that many friends of India feel there is small cause for complacency as to the actual condition of the country under its present rule. More than 180 different languages are spoken. Two hundred and ten millions of the population are engaged in agriculture, earthwork, or general labor. There are nine principal religions; the Hindus numbering 207 millions, and split up into eighty main castes. The degree to which the members of these castes can or cannot eat, associate, even touch, or receive a drink of water from each other, is one of the most curious chapters in the book, and fully explains how India fell an easy prey to wave after wave of conquest.

Regular commissions in the Indian Army have recently been granted for the first time to natives. This marks a significant advance in both Indian education and administration. The "chiefs' colleges," of which the first was founded thirty years ago by Lord Mayo, have been practical failures, mainly because they led to nothing. The one career which the Indian aristocrat regards as most worthy his station, that of arms, was closed to him. Now the graduates of these colleges can enter the Imperial Cadet Corps and receive instruction and training similar to that given at Sandhurst and West Point, and, if they pass the required examination, will receive regular commissions. The success of seven young sons of chiefs in obtaining commissions will doubtless give a stimulus to these colleges and tend to place the education of the Indian aristocracy on a sound and popular basis. In helping to satisfy, also, the aspirations of the highest and most influential class in the country for an important share in the administration, the new policy is solving one of the most difficult problems which have confronted Lord Curzon and his predecessors.

Probably few American students of the history of religions would prefer to read Chantepie de Saussaye's 'Lehrbuch' in a French translation. But those shortsighted ones to whom German is still hard, may now put off a little further the evil day and use the translation made by competent scholars under the direction of MM. Henri Hubert and Isidore Lévy as a manual for the École des Hautes Études (Paris: Armand Colin). The text of the second German edition (of 1897) has been faithfully and lucidly rendered; no attempt has been made to extend it, but some slight modifications, mostly of suppression, have been introduced with the consent of the author. The bibliographies profess to have been brought up to date, but much more could have been done in that way, and what is given is not always accurate. There is an introduction of forty-five pages by M. Hubert.

Mr. John Cotton Dana's annual report for the Newark (N. J.) Public Library is worthy of attention because of its certificate, after three years' occupancy, to the excellent design and structure of the building. The details into which he enters will profit any community about to erect a public library. Mr. Dana announces the "duplicate collection" now wholly self-supporting and a popular feature. Here the charge is a cent a day for new novels.

Dr. Sylvester D. Judd, who has in the Department of Agriculture's Year-book for 1903 a notable chapter on the economic value of the Bobwhite, is author of the Department's Bulletin No. 17 (Division of Biological Survey), entitled 'Birds of a Maryland Farm: A Local Study of Economic Ornithology,' and freely illustrated. The farm in question was studied in constant visits for seven years, with the result of supplying such a knowledge of general local and temporal conditions as would lend the broadest significance to observations. The detail entered into in this most interesting study is suggested by the index, where are grouped Birds eating ants, bees and wasps, blueberries, cherries, elderberries, grasshoppers, etc. (seventeen items in the menu); and by the picture (p. 64) of some common seeds found in crow pellets.

In the *National Geographic Magazine* for June, Col. C. R. Edwards, Chief of the Bureau of Insular Affairs, describes the organization and duties of this branch of the War Department. These may be described, in the words of the act by which it was created just two years ago, as embracing "all matters pertaining to civil government in the island possessions of the United States subject to the jurisdiction of the War Department." Special mention is made of the work of the Bureau in reference to questions of law and the tariff. The existence of land near the North Pole is shown by Mr. R. A. Harris to be indicated by the currents or drifts and tides of the Arctic Ocean. In some notes on Mantchuria, our consul at Niuchwang, H. B. Miller, records the fact that during the winter months "there are not less than 2,000 carts, each carrying two tons, per day coming to the port," many of them competing with the railway in a haul of 400 miles. He believes that, having "the happy combination of a splendid variety and vast quantities of minerals, valuable forests, great agricultural wealth, and an industrious, capable people, whose labor is, perhaps, the best in the world for its cost," Mantchuria will prove in time to be one of the richest sections of Asia. A short account is given of investigations by the Department of Agriculture as to a proposed method of checking the boll weevil by means of a red ant which in Guatemala destroys the weevil, so as to permit the successful growing of cotton.

The British expedition to Lhasa gives a special interest to Mr. Oscar T. Crosby's account, in the *Geographical Journal* for June, of a recent journey in a "corner of Tibet." It is a graphic picture of life on the northern slopes of the Himalayas, and enables one to realize some of the difficulties attending a march from India to the Lama capital. In the discussion of the paper at a meeting of the Royal Geographical Society, Sir T. Holdich called attention to the fact that four hundred years

ago a large armed force of Mongols crossed the Karakoram pass, 18,550 feet, and at the close of the eighteenth century a Chinese army, 70,000 strong, marched 1,600 miles in Tibet and conquered Nepal, to put an end to the raids of the Ghurkas on the Tibetans. This he justly characterizes as one of the most remarkable military movements ever made in the world, and to this day the Nepalese send tribute every five years to China in acknowledgment of its supremacy. Prince Kropotkin, with a luminous array of facts, shows that "desiccation on a great scale has been going on in Northern Asia and Europe through the historical period," and discusses its relations to the age when a large part of this region was covered with ice, regarding it as a "necessary outcome of the preceding epoch of glaciation." Among the other contents of the *Journal* are an illustrated account of the lakes of New Zealand, and a lengthy notice of the recently published facsimiles of the Waldseemüller maps. One of these is the first on which the name America appears, and its two insets are the first instances of a division of the world into two hemispheres, each on its own projection.

Accounts of the geology of the Argentine province Buenos Aires and of Kamtchatka take up the larger part of *Petermann's Mitteilungen*, number four. The robbery of nature through man's destruction of his fellow-man is treated by Dr. Friedrich, who closes his study of an important subject by emphasizing the fact that the growth of population should lead to a careful husbanding of all nature's resources. Considerable space is given to the geographical curriculum of the German universities and high schools for this summer term. We note a course of lectures at Munich University on the history, constitution, industrial and social condition of the United States. Two courses are to be given in Berlin on the discovery, conquest, and religion of Mexico.

The Cologne *Gazette* reports a new decree of the Prussian Government, according to which women who have taken the regular gymnasium course and the university examination are to be allowed the *examen pro facultate docendi*—that is, the examination admitting the successful candidate to the teaching corps of the gymnasium, realgymnasium, or any school of this grade. This for the first time in Germany opens the door of secondary schools to women teachers.

The anti-foreign spirit that has been developing for several years in German universities and polytechnic institutes has found a peculiar expression in a new arrangement made by the authorities of the School of Technology in Darmstadt. The Senate has announced that, during the first three weeks of the term, only Germans will be accorded places in the lecture rooms and the work rooms, and that foreigners can, as students or *hospitants*, gain admittance only in case there are still vacancies after this period. It is announced that this policy meets the long-cherished wishes of the German students, who declare that they were crowded out by the foreign contingent, and that the insufficient preparation of the latter impeded the progress of the better equipped Germans. The University of Freiburg i. B. has just served notice that in future it will under no circumstances admit graduates of the women colleges of Russia.

The philosophical faculty of the University of Berlin has decided to discontinue the "doctor disputation" altogether, and, by the abrogation of this ceremony, has put an end to a venerable academic custom inherited from the Middle Ages. In former times such disputations were a part of the regular programme in the doctor promotions of all the faculties, and the new graduate was compelled to defend his theses in Latin against any opponent who might put in his appearance. In more recent times the Latin had been abolished, and the disputation consisted in a debate prearranged with some friendly critic and was little more than a formality. In the Prussian universities the disputation was obligatory only for those who expected to enter upon an academic career.

"There is," writes a correspondent from the peninsula, "not much excitement nor very great interest in Italy regarding the Petrarch centenary (the sixth); partly, I think, because people are tired of such festivities. Arezzo is doing what she can to arrange a little show. A small prize has been offered anonymously for an essay on Petrarch and Tuscany, sketching the various relations of all kinds which unite mother-country and son. Best of all, Rajna and others, aided by a Government appropriation, are preparing an edition of the poet's Latin writings, so long a desideratum, as the last one dates from the middle of the sixteenth century."

We read in *Minerva* that the Bros. Bocca have just published an Italian version of Emerson's 'Representative Men.' This is the first time that the work has been thus honored. Indeed, since 1867, the only Italian translation from him has been a collection of extracts on character and the conduct of life, in 1888, 1889; a neglect but slightly less than that which has befallen Lowell in Italy.

The mutual study of Japanese and English is being prosecuted in Japan with a seriousness worthy of all regard. The *Student* (published at No. 16 Gobancho Kojimachi-ku Tokio), a well-printed and illustrated semi-monthly magazine of 32 pages of the ordinary size, has reached its twenty-first number. Its editors are Dr. Inazo Nitobé, Alice M. Bacon, Anna C. Hartshorne, Umé Tsuda, and H. Sakurai. The issue, combining numbers 20 and 21, is a "Commodore Perry number." It has portraits of the naval diplomatist as he was in reality, and also in the conception of the Japanese of 1853. In both of these representations the nose is the most terrific feature. In another, "the envoy of the American king" is unmistakably of "Dago" origin, with a cross stuck in his hat. Count Okuma, the leader of the Progressive party, contributes a notable article of six pages entitled "Japan and the Anglo-Saxon Race." He pays a high tribute to Sir Harry Parkes and especially to Townsend Harris, and gives his reasons why Japan attaches herself to "the race which values the people's rights above all things." In his view the Japanese Empire is a sort of patriarchy, and the emperors of all generations in Japan have done their utmost to protect the people. Japanese civilization has centred around the Imperial House. Fine arts, morality, and literature have all developed around it, or come out of it; and while the people of Japan have never tried to lessen the imperial power, the Emperor has ever been anxious to advance the people's rights. Thus the soil of Japan was already prepared for receiving the civilization of the Anglo-Saxon nations. Other contributors are Profs. E. W. Clement and Uchimura, and Mr. Tsuzuki, chief secretary of the Privy Council. There are also corrected papers with notes and explanations. A magazine so rich in interchangeable idioms, provided it can be kept up with such fulness and ability, cannot fail to make more students of Japanese and native learners of English.

From Palestine comes the report of the discovery by the German explorers at Mutesellim, presumably the ancient Megiddo, of a fine jasper seal, having as device a lion marching, with the inscription, above and below, in very old Phœnician characters, "of Shema', the servant of Jeroboam." Presumably it was the seal of the governor of that city under King Jeroboam; but which Jeroboam it is not possible to determine. This seal possesses a peculiar value because it is the first object found in the excavations conducted in Palestine bearing a well-known Biblical name. The fact of the existence of such a seal of the time of Jeroboam is something like a guarantee that further inscribed material of the Israelite period will turn up. This seal was found by Dr. Schumacher in March. On the 20th of May Mr. Macalister, excavating for the English Palestine Exploration Fund at Gezer, on the road from Jaffa to Jerusalem, reported the discovery of a fragment of a tablet written in cuneiform characters, thirteen lines on one side, five on the other, with seal impressions between. This is the sixth tablet inscribed in cuneiform characters from the pre-Israelite period, approximately 1400 B. C., discovered to this date in Palestine. The first was found by Dr. Bliss at Lachish, and four (three of clay, and one of stone) by Dr. Sellim at Ta'anach, four miles east of Mutesellim.

—The July *Century* is specifically a fiction number. Margaret Deland contributes the most interesting of the short stories—not a new phase of Dr. Lavender this time, but a problem of the ethics of authorship. The hero, under the burden of prolonged ill-health and financial difficulties, brings the story to its crisis by burning a manuscript for which he has just received an offer of $7,000, rather than to run the risk of being persuaded by the entreaties and reproaches of his wife to publish inferior work, contrary to the promptings of his own conscience. In former days such a man would have received his reward before the curtain fell, but Mrs. Deland is content to help him over the edge of the frying-pan with no apparent concern as to the inevitable fire below. Miriam Michelson's second story of the Nevada Madigans is hardly up to "Cecilia the Pharisee," of the June number, but she has a mine which is capable of putting out a fair quantity of high-grade ore before it is exhausted. Among the contributions of serious interest, Andrew D. White's recollections of his service as an attaché of our minister to Russia during the Crimean War easily takes the lead. Mr. White rather regrets that the system of attachés has been dropped from our diplomatic service. Certainly its possibilities for usefulness must be rated high when one recalls that

Andrew D. White and Daniel C. Gilman simultaneously entered the service in this capacity with Minister Seymour. To Russia's slowness in catching the modern spirit, especially as illustrated in her failure to discard inferior weapons for more recent inventions, her lack of success in the Crimean struggle is largely attributed. In connection with this opinion, and in view of current events in the Far East, it is interesting to read in the same number an article by Baron Kentaro Kaneko on the Magna Charta of Japan, bringing out in a striking way the eagerness of the Japanese to adapt themselves to present-day conditions. Still another contribution to the same field of interest is a paper on Mantchuria by Consul James W. Davidson. Sylvester Baxter gives a well-illustrated description of the changes which have been authorized in the grounds and buildings of the Military Academy at West Point.

—Central Asia, if not the original home of the Indo-European and Mongolian races, was certainly one of their important resting-places, and, so far as present information goes, the home also of some of our most important domestic animals. During the Christian era, and as late as the fourteenth century, Turkestan, with its great and wealthy cities like Merv and Samarkand, played an important part in history. Numerous ruin mounds, scattered all over the surface of the country, attest its importance in the more remote past. With a grant from the Carnegie Institution of Washington, Prof. Raphael Pumpelly has commenced the excavation of some of those mounds in Russian Turkestan, just over the northeastern frontier of Persia. In a preliminary letter distributed by the Institution he gives some account of the excavation of a ruined city, Anau, surrounded by a moat and wall and occupied until within the last century, and of two great tumuli, each about a mile from Anau in the immediate neighborhood of Ashkabad (or Ashabad). A partial examination of these three sites—consisting "in terracing above the plain and in large open pits and shafts below that level" down to the original plain level, which is more than twenty feet below the present level of the plain—shows that these three sites were occupied not contemporaneously but consecutively. The result is that Professor Pumpelly seems to have been able to explore 174 consecutive feet of culture strata—a depth far exceeding that which has been found at any one point in Egypt or Babylonia. The first tumulus represents in the lower two-thirds the stone age. In the upper third the inhabitants were beginning to use copper. The second tumulus, in its lower two-thirds, represents the copper age; in its upper third, iron. The pottery of the first tumulus is entirely handmade. In the second tumulus we begin to meet with wheel-made pottery. The ruins of the city of Anau lie entirely within the iron age, and from the outset glass and enamelled pottery occur. Apparently, the foundation of this last city was contemporary with the commencement of irrigation in that section. Professor Pumpelly is very careful to make no effort to give dates, but from what he has reported so far concerning objects found, it would seem probable that the second tumulus began to be inhabited some time a little after 3000 B. C.; and the city of Anau a little before the commencement of the Christian era. The first tumulus, with its accumulation of 60 feet of débris, represents, roughly, the period antedating 3000 B. C. No written remains have been discovered in this tentative examination. Professor Pumpelly reports the discovery of vast quantities of fragments of pottery, hundreds of pounds of bones and the like, which have been sent to specialists for investigation.

—The opening of the new Library building at Somerville College on June 11 brought Mr. John Morley to Oxford for the opening address. After listening to him, the young ladies of the college entertained a large company of friends, among whom were the leading graduate members of the University. Using the poem "Demeter, a Masque," especially written for performance on this occasion by Mr. Robert Bridges, and music composed for the first two of Mr. Bridges's three songs by Mr. W. H. Hadow, and for the third song an air adapted from one of Schubert's piano compositions, these gracefully costumed amateurs afforded to the guests of the college an interesting and unique experience. The pillars and open entrance hall of the new Library were their stage-building, and the lawn in front of it was their stage as well as their audience room, bounded on various sides by leafy avenues of trees. "Hades," writes a correspondent, "prologized ominously until the chorus of Oceanides brightened the scene by their joyous entrance. Persephone, Athena, and Artemis were soon there, gathering the flowers of spring in the Sicilian vale of Enna. Left for a moment alone, Persephone was dragged away screaming by Hades, her captor. Upon this the chorus, with graceful movements of lassitude and despair, recounted in monotone to a lovely musical accompaniment their vain search, closing with

> " 'Now, since she is gone,
> All our dance is slow.
> All our joy is done
> And our song is woe.'

Demeter then entered, full of reproaches for the Oceanides. These finally merged into a calmer descriptive passage about her own fruitless search and the sad truth revealed by Helios. Next came a wonderfully worded and strikingly recited transition to wrath against Zeus, her undoer. The sympathetic voice lent to Demeter's part by the young lady who so well sustained it, made of this scene a memorable poetical experience, which culminated at last in the fine dialogue between the injured Queen and the Messenger of Zeus, dispatched to summon her to Olympus. Defiance outfaced expostulations and persuasions, and Demeter at last stood alone in the majesty of grief and indignation. Followed the first song, a dirge for the lost Persephone, uttered to the accompaniment of solemn movements and groupings pertaining to woe. The next and last scene, that of the restoration, was again dominated by Demeter, whose gradual reconcilement, under the persuasions of her daughter's love, was poetically distilled into the minds of all beholders by gestures and motions as well as by rhythmical speech." It is to be hoped that Mr. Robert Bridges may not long delay the publication of this Masque.

—The 'Transactions of the Royal Historical Society' for 1903, New Series, Vol. XVII. (London, published by the Society), contain a presidential address by Dr. G. W. Prothero and six essays on subjects mainly mediæval. Mr. Prothero's address takes the form of a proposal for a bibliography of English history since the end of the Middle Ages. The publication of Professor Gross's 'Sources and Literature of English History' has caused a good deal of generous shame to burn in the hearts of those who neglected to anticipate it, and we imagine that this fine work will prompt some scholar or band of scholars in England to take up the bibliographical thread at 1485, where Dr. Gross dropped it. Mr. Prothero, scandalized at the lack of such a manual, is led to make some candid observations regarding the defects of English character. His main point is that the English "are *not* practical in the higher and more positive sense of the word." After giving due credit to the national virtues, he proceeds: "But of the higher practicality, which consists in forethought, preparation, system, the qualities which make for national efficiency, [the Englishman] has, I fear, but a very small share. He takes routine for method, tradition for experience, habits for principles; he calls a man of ideas a star-gazer, and stigmatizes foresight as speculation; and he instinctively shrinks from, if he does not actively detest, education in general, and all knowledge that does not bear directly on the subject that he has in hand." Into the details of Mr. Prothero's bibliographical proposals we shall not enter, stating only that he offers interesting criticisms of the chief bibliographies which exist at the present time, and indicates the principles upon which such a work as he advocates should proceed. We might add that his scheme is a very large one, and would require the coöperation of numerous enthusiasts. The six essays which are also published in this volume maintain a high standard of learning and deserve the attention of professional historians. The subjects and writers are as follows: "The English Premonstratensians," by Dr. F. A. Gasquet; "The Intellectual Influence of English Monasticism," by Miss R. Graham; "Royalist and Cromwellian Armies in Flanders," by Dr. C. H. Firth; "The Development of Industry and Commerce in Wales During the Middle Ages," by Mr. E. A. Lewis; "Italian Bankers and the English Crown," by Mr. R. J. Whitwell; "Bondmen under the Tudors," by Mr. Alexander Savine.

DALHOUSIE'S INDIAN ADMINISTRATION

The Life of the Marquis of Dalhousie, K. T. By Sir William Lee-Warner, K.C.S.I. 2 vols. Macmillan. 1904.

It is now nearly forty years since one of the most accomplished and amiable Englishmen of the nineteenth century, William Johnson Cory, wrote in his diary. "I should like to write a biography of some man of my own time whom I reverence. In particular I should like to write the life of Lord Dalhousie." The task to which the Eton master aspired (and it is a remarkable circumstance, in this connection, that the life of another great Viceroy, Lord Lawrence, is written by a master of Harrow, and that the best history of the Indian Mutiny is by a master of St. Paul's School) was at the time impracticable on account of the

jealous seclusion of Lord Dalhousie's official papers, which, except in so far as copies might exist in the public archives, have remained hermetically sealed until very recently. It must be concluded that Dalhousie, broken in health, though not in spirit, by eight years of incessant labor in a trying climate, felt himself unequal to the vindication of his administration from the heavy indictment to which the apparent collapse of British power in India had exposed it, and remitted the whole question to a more impartial posterity. He has undoubtedly profited by the skill and thorough knowledge of the advocate upon whom his rehabilitation has devolved—a trained Indian official, acquainted with every detail of government by long Indian employment in a variety of posts, and who continues his services to India since his return to England.

Perhaps the term "rehabilitation" should not be used with reference to the official character of Lord Dalhousie, for the severity of censure with which he was at one time assailed has long ago died away, while at the same time it is in vain to pretend that he occupies the same position in the estimation of his countrymen that he might have held if the Mutiny had never taken place. The disillusion was too rude, the shock too violent, the ensuing reversal of Dalhousie's policy in many respects too conspicuous. "The instability of the British Empire in India," said the *Edinburgh Review* at the height of the crisis, "is an idea so unfamiliar to the vast majority of our countrymen in the present generation, that, if the events of the past year had not given to that expression a significance it never had before, the words would scarcely fall from the lips of an Englishman." "As regards the chances of internal warfare," the *Calcutta Review* had said in a perfect pæan of triumph penned during the latter days of Dalhousie's government, "we may well ask if there is anywhere a native prince who would dare to meet in open field a British force of 10,000 men?" The British people could hardly help feeling that they had got a serpent for a fish; and that, moreover, insult had been added to injury by the representation that the serpent actually was a fish. On the whole, they did not come badly out of as trying an ordeal as the justice and temper of a nation ever were subjected to. Much was said unwisely and ungenerously; but with any other than an Anglo-Saxon people the sayings would have converted themselves into doings of a much more regrettable nature. Generous men like Cory meanwhile were drawn over to Dalhousie's side by a perception of the injustice which he encountered and the magnanimity with which he supported it; and, as the nobler feelings in human nature are more abiding than the baser, it is even possible that sympathy may award him a higher rank among the rulers of India than strict justice can confirm.

The best apology for his errors is the fidelity with which he represented ideas generally accepted at the time—the belief in the natural tendency of events to bring the whole of India under immediate British sway; and the conception of British rule as essentially a missionary and civilizing influence. Dalhousie was the very incarnation of these ideas. There is no ground for charging him with intentional injustice towards the native, unless when he extinguished, or amerced in money or territory. The two most important of his annexations, the Punjab and Oude, were obvious necessities, although the latter was made to wear an aspect of violence which might have been avoided. But the general tenor of his policy left no doubt that, though he would neither play false nor wrongly win, he would miss no opportunity which he thought fair of extending British territory and influence; and the impression was strengthened by the generally Occidental character of his legislation. Indians could not but feel that the tendency of his measures was to Europeanize them; and when at length the careless and stupid blundering of minor officials ignited a little spark of revolt, the flame spread without hindrance from the alienated native rulers and the estranged native middle class.

Yet, in all he had done, Dalhousie had had English public opinion at his back; the nation was *particeps criminis*, and a public outcry against him would have been most discreditable to its sense of fairness. Whatever individuals may have spoken or written, we cannot, however, find any evidence of a national censure of his policy, beyond the practical step of silently dropping it. Since his time the effort has been to convince the native princes that their interests are one with those of the paramount power. While maladministration is more severely checked than under Dalhousie, and the dethronement even of an incompetent prince is no uncommon occurrence, annexation (excepting in the case of a foreign conquest like Burmah) is almost unheard of. The attitude of mind which prevailed throughout the British nation in Dalhousie's period, and of which he was but the instrument, is recognized as fundamentally mistaken. The East is not to be conquered by European ideas, but, if possible, to be permeated by them. The empire is to be made impregnable, not by rigidity, but by elasticity. It is true that these are not the ideas of the average Briton. It is a fact of baleful omen that the three Viceroys who have most fully recognized the native claim to equality—Lord Lytton, Lord Ripon, and Lord Curzon—have been the least popular in Anglo-Indian society. But the principle of partnership, instead of the principle of extrusion, is now too fundamental a maxim of British policy to be easily disturbed.

Dalhousie, then, cannot be reckoned among the first class of statesmen—those who create and impose policies. His vindication (and it is a sufficient apology for the errors of his administration) is that he was not the inspirer but the instrument of the public opinion of his day. The complaint most commonly made against him during his term of office was not that he was too much of an Anglicizer, but that Anglicization did not under him proceed fast enough. He followed where he seemed to lead. He also wanted another indispensable qualification of the first-class statesman — the ability to take comprehensive views and regard the object immediately before him in its relation to the general course of affairs. He was carrying out two great plans, each calculated to offend and estrange Indian public opinion, and the more necessary they were in some measure, the more careful he should have been to conduct them with a minimum of friction. It was quite enough to be compelled to make the two great annexations from which there was no escape, the Punjab and Oude, without increasing ill will by minor appropriations of doubtful justice, like Nagpur, or adding nothing to the strength of the empire, like Satara and Kerowlee. Another class of his measures was even more calculated to offend, and yet was inevitable. He could not without dereliction of duty omit to protect converts and violators of caste rules from outrage and persecution; and the entire course of his legislation in restraint of native intolerance was in the abstract most honorable to him. But he should have considered that in simultaneously attacking national sentiment and religious fanaticism he was burning the candle at both ends. It was also a blot upon his otherwise valuable creation of a Legislative Council that at first native opinion was very inadequately represented upon it. Nor, as his rebuke to Henry Lawrence shows, had he in the least realized the advantage which the empire might derive from the enlistment of hardy races like the Sikhs and Goorkahs.

Dalhousie's claim on the admiration of posterity is not, therefore, so much in the character of a statesman as in that of an administrator. Here he is beyond praise. We have been compelled to confine this notice to general considerations from the sheer impossibility of comprehending his particular achievements within the limits of a review. Military organization, public works, finance, education, legislative and judicial procedure, were all transformed by him. The railway and telegraphic systems of India are mainly his creation. More important still, perhaps, was the example he set of indefatigable activity and swift decision. "He was as rapid," says Cory, "as Henry VIII." Sir William Lee-Warner has done ample justice to him in every respect. It is to be regretted, but was inevitable, that he should have been unable to find room for the great Minute in which Dalhousie reviewed the performances of his administration—a document, as a record of material achievement, almost comparable to the Ancyra inscription of Augustus. But Augustus, though scarcely a man of heroic mould, possessed that insight into his age, and that faculty for inspiring enthusiastic devotion to his person and system, which discriminate the statesman of genius from the eminent ruler of the second class.

SOME MUSICAL WORKS.

Henry J. Wood. By Rosa Newmarch. John Lane.

The Story of the Organ. By C. F. Abdy Williams. Charles Scribner's Sons.

Modern Organ Tuning. By Hermann Smith. Scribners.

Harmony; Its Theory and Practice. By Ebenezer Prout. London: Augener & Co.; New York: Edward Schuberth & Co.

Of a series that is to include "Living Masters of Music," it must be said that if they all prove as good as the first, Rosa Newmarch's monograph, the lovers of musical literature are to be congratulated. The author had the advantage of being obliged to go to headquarters for her information. She pronounces Mr. Wood "unquestionably the central figure in

English musical life"; his influence certainly led to a great quickening of that life. For nearly two centuries the "oratorio industry" had absorbed the best as well as the worst of the English musical material. Mr. Wood and Hans Richter smashed this monopoly, and led to a new movement which became so popular that it was referred to as the "orchestral craze." New compositions, and older ones that had been shamefully neglected in London, were brought out by Mr. Wood in abundance. The author gives a list of these novelties which covers seventeen pages and which includes MacDowell's "Indian Suite" as America's share—small, to be sure, but better than nothing. For Mr. Wood, we are told, there is "no such word or thing as drudgery"; he owes much of his success to his "power of kindling interest in his own ideas and hopes." He is one of the most emotional and individual of conductors, and Rosa Newmarch remarks that "the complaints against individual interpretation in music come from those whose emotional gamut is very limited in compass, and whose emotional tone is of the thinnest quality. Such people are as out of place in the concert room as those of low physical vitality are in the football field." This is well put, and the author does not claim too much when she writes that, "in this matter of vitalizing what he renders, I should unhesitatingly place him next to Nikisch among the interpretative subjective conductors." Special chapters treat of Mr. Wood's relation to vocal art, and his missionary work for the Russians. It was thanks to him that Tchaikovsky became as popular in London as Wagner.

Mr. Abdy Williams justly refers to the organ as a "wonderful outcome of human ingenuity and skill," and he attempts, in eight chapters, to trace its development from the mechanically blown trumpet of Ctesibius in Alexandria to the present day. The latest phases receive less attention than the earlier ones, yet nothing of vital importance seems omitted. Some use is necessarily made of technical terms, but an appendix furnishes explanations for the general reader. There are about forty illustrations, of famous old instruments and transitional forms. Nor are the organists passed over in silence; they are of all grades, from those concerning whom the sixteenth-century composer Hermann Finck wrote that their performance was "just as agreeable as the braying of an ass," to men of genius like Mendelssohn, one of whose chief delights was the trying of instruments in various cities. In Munich he was disappointed because, on a certain organ, he could not play any passage of Bach, as it was wanting in the five uppermost keys. Yet he rejoiced in it because, as he wrote to his sister, "for the melody itself there is a clavier which contains only reed stops, so I draw a soft oboe, a very soft clarion of four feet, and a viola. The choral comes out so quietly and yet so penetratingly that it seems like distant human voices singing from the bottom of the heart."

One of the unpleasant things about organs is their habit of getting out of tune; they share this with the pianoforte, but the damage is much less easy to repair. Some years ago Hermann Smith wrote a book on pianoforte tuning, of which several editions were called for. His aim in this case was to enable a player to tune his own instrument—a desirable accomplishment in regions remote from musical centres. In the case of the organ, on the other hand, he would not, as a rule, encourage players to attempt to set matters right themselves, as the resulting damage might be serious. His hints are, therefore, intended chiefly for builders, who, as he shows us in his 120-page treatise, are confronted by a surprisingly large number of subtle problems.

Harmony is the modern element in music, only a few centuries old. It is a complicated structure, gradually built up by the great masters; and one of the strangest things about it is that every advance made in it was condemned by the critics, and, for a long time, ignored by the theorists. Haydn, when asked according to what rule he had introduced a certain harmony, replied that "the rules were all his very obedient, humble servants"; Beethoven grimly laughed at those who questioned his harmonic practices; and the alleged infractions of the rules have been merrily going on ever since, such composers as Schubert, Wagner, Chopin, Liszt, and Grieg being practically laws unto themselves. Teachers of harmony have not hesitated to say to their pupils: "Bach is wrong," or "Beethoven is wrong," or, at best, "This is a license."

Not so Prof. Ebenezer Prout, whose maxim is that "the principle must surely be wrong which places the rules of an early stage of musical development above the inspirations of genius; . . . and when we find that in our own time Wagner, or Brahms, or Dvorák breaks some rule given in old text-books there is, to say the least, a very strong presumption, not that the composer is wrong, but that the rule needs modifying." It is from this point of view that he has written his treatise on harmony. Many rules now obsolete, and contravened by the daily practice of modern writers, he has omitted altogether, and others he has modified greatly, while the laws affecting the chords of the ninth, eleventh, and thirteenth have been simplified and classified by him. The result is a thoroughly up-to-date treatise, which cannot be commended too highly to pupils and teachers. That it has been found useful already is evidenced by the fact that fifteen editions of it have been called for in twelve years. The present, sixteenth, edition is a great improvement on its predecessors, being practically a new book, greatly enlarged and in part rewritten. One of the new features is that, from the beginning, the harmonizing of simple melodies is taught simultaneously with the harmonizing of figured basses. There is room for disagreement with some of Professor Prout's conclusions, but this merely shows that the theory, like the practice, of harmony is still in a state of evolution.

Chambers's Cyclopædia of English Literature. New edition by David Patrick, LL.D. Volume III. The Nineteenth Century. London: W. & R. Chambers; Philadelphia: Lippincott. 1904.

This volume, concluding the Cyclopædia, has for its frontispiece a portrait of Sir Walter Scott, and for the subject of its first biography Wordsworth. But Mr. Watts-Dunton contributes a prelude on "The Renascence of Wonder in Poetry," intended to characterize the revolution which affected "the very soul of poetry" everywhere, with the English race in the van and the 'Lyrical Ballads' at the head of the movement for England if not for the world. This prelude is frankly a development of the writer's introduction to his own 'Aylwin' (misprinted "Alywin" on page 2). It deserves to be lingered over and re-read, and is alone worth the price of the volume; not solely for its thesis, but for its general sweep and its incidental judgments. Mr. Watts-Dunton has two other contributions of importance, the article on Byron, and that on George Borrow; the latter being, for peculiar reasons, one of the few sketches in this volume for which one might not better refer to the Dictionary of National Biography. Compare, for instance, Mr. Lehmann's notice of Dickens with Leslie Stephen's.

Carlyle opens, nearly enough, the second half of the volume, and is disposed of, selections and all, in eleven pages; about the same space being given to Thackeray and to Dickens, against some eighteen pages to the Brownings, less than nine to Tennyson, less than seven to George Eliot, almost five to Edward FitzGerald. Mr. William Wallace, who treats of Carlyle, says rightly that, "even as an historian, he was, and could not help being, prophet, preacher, and poet," and this is the single allusion to his poetic quality. But in the case of the 'French Revolution,' Mr. Wallace quite misses the essentially poetic nature of the presentation, which will appear very striking to any one who compares it with Carducci's sonnet vignettes, "Ça Ira." Mr. Wallace is more anxious to observe, with a confidence not beyond question, that Carlyle's "view of that still imperfectly understood social convulsion is now the world's." Since the historian sometimes dropped into actual verse, we should have liked to find among the selections his "Symbolum," for example. Stranger we think it that among the extracts under Charles Darwin nothing has been taken from his Autobiography, though this is most strictly his literary monument. Finally, to have done with the British section, there is a "complementary list" of recent and contemporaneous authors such as our memory can recall to have embraced Tennyson in the first edition of this Cyclopædia which fell into our hands. He was then visibly nothing but a poet of promise, whose career would be watched with interest.

The American section is ushered in by a brief disquisition on American literature from its slender beginnings, by Professor Woodberry, who then exhibits Cotton Mather, Jonathan Edwards, Franklin, John Woolman, and Washington, with one or more extracts; that from the Quaker Woolman not suggesting the peculiar humor which attracted Charles Lamb to his Journal. After Mr. Woodberry, the Rev. John W. Chadwick has been intrusted with the greatest number of significant writers, and Dr. Patrick's choice of a co-laborer could here hardly have been better. The Whitman is an exceptionally sound and just performance. We remark that more than half of the poetic extracts from Longfellow Mr. Chadwick takes from the sonnets, his later products, but none from Lowell's. Emerson was reserved for President Schurman, who rather curtly dismisses his poetic output as hard sledding and relatively unim-

portant, and cites only his "Rhodora." This is scant measure for the first American poet —or who is the first? In contrast, Mr. Watts-Dunton gets three pages of exemplification; but who that is not confused by the Englishman's supremacy as a critic of verse will expect from him, even with the élite, a memory and a cult like that which the poet Emerson may look forward to? Lincoln, among the prose writers, bears his Gettysburg speech in his hand, and we could have wished it accompanied by the higher eloquence of the second inaugural. In the American complementary list, it would perhaps be difficult to explain the principle of division between this company (not of the living alone) and that of the preceding ten pages of brief mention, so that the apparently more honorable position falls to Stephen Crane, for example, the less honorable to Edward Everett Hale. Neither grouping throws any light on the question, Who is to-day the leading American poet?

On the whole, the Cyclopædia maintains its title to a place in every library of reference, public or private. The portraits fall a little short of numbering 150.

Whittier-Land: A Handbook of North Essex, Containing Many Accounts of and Poems by John Greenleaf Whittier never before Collected. By Samuel T. Pickard, author of 'Life and Letters of John Greenleaf Whittier.' Illustrated with map and engravings. Boston: Houghton, Mifflin & Co. 1904.

Whittier has been fortunate in his principal biographer, at once so candid and so affectionate, and Mr. Pickard's assumption of this minor task, a guide-book to the Whittier region, assures a piece of work at once reverently and carefully done. Whittier has been equally fortunate in the domestic associations of his early life, the homestead situated so pleasantly, the house built by his first American ancestor in 1688, and preserving so much of its original character, though once (1902) "saved as by fire." The Amesbury house, enlarged from the tiny cottage to which Whittier moved in 1836, is so commonplace in appearance as almost to chill the genial current of its personal associations. Whittier does everything for it, the house nothing for Whittier. One secret of some interest it gave up in 1903, when it was undergoing repairs. Hid in the wall was a package of letters, one of them from Lewis Tappan, revealing Joseph Sturge, the English Quaker abolitionist, as the benefactor whose $1,000 enabled Whittier to build a new part of the house much larger than the old. The birthplace and the later home are carefully described, and, without forcing the note, every circumstance available for the illustration of Whittier's life and poetry is economized, and every place and person vividly associated with his person and experience is made to yield some increment of interest to Mr. Pickard's aggregation of instructive and entertaining matter.

The heretofore uncollected matter is not of such value as to import neglect in the official biography; but here and there we have some expansion of that or a rendering notably fresh and different. Garrison's first visit to Whittier, for example, wears a more rueful color here than in the biography. The boy was, it seems, at the moment of Garrison's arrival, engaged in burrowing under the barn for a hen's stolen nest. Unwillingly he gave over the quest and went to change his clothes, but, getting into the wrong pair of trousers, made a more awkward appearance than if he had presented himself for his first honorable recognition "not without dust and heat." But Mr. Pickard's additions to his former presentation will be most highly appreciated where they carry farther the identification of the various personal objects of Whittier's interest and affection, immortalized by him in verse. We are sure now that the little heroine of "In School Days" was a next neighbor's daughter, Lydia Ayer. Unfortunately, the picture of the schoolhouse is drawn from memory. The vision cherished in "My Playmate" and "Memories" is identified with Mary Thomas, who married Judge Weld of Coventry, Ky. Our poet's sense of the phonetic value of proper names was generally so sure that one reads with astonishment that the line,

"The pines were dark on Ramoth Hill,"

was due to James T. Fields's dissatisfaction with Whittier's first form,

"The pines were dark on Menahga Hill."

The most interesting of these sentimental identifications is that of Evelina Bray with the girl described in "The Sea-Dream." Whittier's loveliest poem. She was from Marblehead, and was Whittier's schoolmate at the Haverhill Academy. We have heretofore conceived that it was from her that Whittier got the story of Skipper Ireson's ride, for he avowed its derivation from a Marblehead schoolmate, and no other has been identified. But in her old age the lady denied her responsibility. It would have been poetic justice if she had been permitted to atone for the ballad, to which the Marblehead people are foolishly averse, by the beautiful stanzas in which Whittier confessed his early admiration. Whittier's sensibility was remarkable, but his affections were always straying "out of Society," and he was too loyal to his parents and to the Quaker order to follow the inclinations of his heart. There are pictures of Mary Thomas and Evelina Bray in their autumnal grace, and there is one of Evelina as a rose-crowned girl.

It should be said that the numerous illustrations are excellent, and sincerely appropriate to the text. The chapters "Whittier's Sense of Humor," "Uncollected Poems," add more to the bulk than to the value of the book, any profit accruing from the sale of which, by the way, will be devoted to the preservation and care of the Haverhill birthplace and the Amesbury home.

Excavations at Phylakopi in Melos, Conducted by the British School at Athens. Supplementary Paper No. 4 of the Society for the Promotion of Hellenic Studies. Pp. 280. Plates 41. London and New York: Macmillan. 1904.

The (British) Society for the Promotion of Hellenic Studies will celebrate on July 5 of this year the twenty-fifth anniversary of its formation. Like the Archæological Institute of America, it was formed in 1879. It has been fortunate in the permanence of its organization, having had but two presidents, Bishop Lightfoot and Sir Richard Jebb, and one secretary, Mr. George Macmillan. Of the fifteen scholars who published papers in the first volume of the Society's *Journal of Hellenic Studies,* only two have died—Sir Charles Newton and Dr. A. S. Murray, Sir Charles's successor as keeper of the Greek and Roman antiquities in the British Museum, who has just passed away. The Society was founded to advance the study of Greek language, literature, and art, and to illustrate the history of the Greek race in the ancient, Byzantine, and Neo-Hellenic periods, by the publication of memoirs and unedited documents in a journal to be issued periodically. The *Journal of Hellenic Studies,* now issuing its twenty-fourth volume, has occupied this broad field, publishing with impartiality Allen's text-critical discussions of the Homeric Hymns, the Provost of Oriel's work on the Epic Cycle, Sir Richard Jebb's charming papers on Pindar (the truest literary appreciation of that poet in like space), Freeman's views on the Later History of the Greek Language, Professor Bury's on Lombards and Venetians in Euboea, Ramsay's Studies in Asia Minor, Bent's Cyclades, Percy Gardner's Numismatic Commentary to Pausanias, Waldstein on the Frieze of the Parthenon, Penrose on the Ancient Hecatompedon—to name but a few characteristic papers. The annual summaries of the progress of archæology in Greece have been convenient and good—particularly those by Ernest Gardner. It is one of the very best philological and archæological journals.

The Society for the Promotion of Hellenic Studies bears almost exactly the same relation to the British School of Archæology at Athens as the Archæological Institute bears to the American School of Classical Studies at Athens—the Society founded the School and has supported the latter's explorations and excavations. Of the first three supplementary papers published by the Society, the most important was the report of the excavations at Megalopolis, published in 1892. That was in folio form, but the volume before us, requiring no elaborate architectural plates, has the form of the *Journal.* This is an excellent and prompt publication of the work of excavation conducted in 1896-99, and gives a clear account of the problems met and the results achieved. Phylakopi was the site of the earliest capital of Melos, and Melos was one of the most important members of the Ægean League, of which Crete was at the head. Melian pottery has been found at Cnossus, and the art of the wall paintings of a seated man and of flying fish at Phylakopi bears such a resemblance to that of the frescoes in the palace unearthed by Mr. Evans at Cnossus, that the suggestion is reasonable that a Cretan artist may have been imported for the decoration of the Melian palace. In the volume before us, Mr. Evans has a chapter on Pottery Marks, and notes two double axes, as well as other marks which recur in the Cnossian linear script. But, on the other hand, the great hall of the palace at Phylakopi had its hearth in the middle, like the palace at Tiryns, and has no such light-well at the back as the palace at Cnossus, and may have been built for a family which had come from the Argolid. The island of Melos contains the only abundant supplies of obsidian in the Mediterranean basin, and the obsidian industry must have been the chief source of prosperity of the ancient city on the

site of Phylakopi. An interesting chapter of this volume is devoted to the obsidian manufacture and trade, with comparisons of Aztec uses. The obsidian knives and arrowheads found at Mycenæ are supposed to have been brought from Melos, and the same conjecture of source is made even for the obsidian objects found among prehistoric and early-dynastic remains in Egypt. At Phylakopi are vast masses of obsidian fragments and half-used cores from which knives had been obtained. The material was so abundant that waste was disregarded. Near the quarries are large quantities of fragments which had been removed in order to fit the obsidian mass for export. Naturally, when bronze arrowheads and knives came into use the obsidian industry waned, and no ancient remains have been found at Phylakopi of a date later than the Mycenæan age, or, in round numbers, 1000 B. C.

The importance of these excavations lies in the fact that they furnish the missing link between the cist-tomb period and that of Mycenæ. This is the only site yet discovered that "exhibits the Cycladic civilization in all the outstanding phases of its development from the earliest beginnings to the age of decline." When the British explorers went to Melos in 1896 they were not without hopes of finding some work of classical sculpture, though it might not be so beautiful as the "Venus" of Melos now in the Louvre, or the Poseidon which is now in the national museum at Athens; but tentative excavations were forbidden by the Greek Government, and the explorers were confined to the examination of land which they purchased as containing manifest indications of ancient walls.
